AC-1		Access Control Access Control Policy and		The organization:	This control addresses the establishment of policy and procedures for the effective	PM-9	P1	х	х	х	
		Procedures		a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a. 1. An access control policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and a.2. Procedures to facilitate the implementation of the access control policy and associated access controls; and b. Reviews and updates the current: b.1. Access control policy [Assignment: organization-defined frequency]; and b.2. Access control procedures [Assignment: organization-defined frequency].	implementation of selected security controls and control enhancements in the Ac Tamily, Policy and procedures reflect applicable federal always. Executive Orders, directives, regulations, policies, standards, and guidance. Security program policies and procedures at the organization level may make the need for system-specific policies and procedures unnecessary. The policy can be included as part of the general information security policy for organizations or conversely, can be represented by multiple policies reflecting the complex nature of certain organizations. The procedures can be established for the security program in general and for particular information systems, if needed. The organizational risk management strategy is a key factor in establishing policy and procedures.						
AC-2	1	Access Control Account Management		The organization: a. Identifies and selects the following types of information system accounts to support	Information system account types include, for example, individual, shared, group, system, guest/anonymous, emergency, developer/manufacturer/vendor, temporary, and service. Some of	AC-3,AC-4,AC-5,AC- 6,AC-10,AC-17,AC-	P1	х	х	х	
				organizational missions/business functions: [Assignment: organization-defined information system account types]; b. Assigns account managers for information system accounts; c. Establishes conditions for group and role membership; d. Specifies authorized users of the information system, group and role membership, and access authorizations (i.e., privileges) and other attributes (as required) for each account; e. Requires approvals by [Assignment: organization-defined personnel or roles] for requests to create information system accounts; f. Creates, enables, modifies, disables, and removes information system accounts in accordance with [Assignment: organization-defined procedures or conditions]; f. Notifies account managers: h. 1. When accounts are no longer required; h.2. When users are terminated or transferred; and h.3. When individual information system usage or need-to-know changes; l. Authorizes access to the information system based on: l.1. A valid access authorization; l.2. Intended system usage; and l.3. Other attributes as required by the organization or associated missions/business functions; f. Reviews accounts for compliance with account management requirements [Assignment: organization-defined frequency]; and k. Establishes a process for reissuing shared/group account credentials (if deployed) when individuals are removed from the group.	the account management requirements listed above can be implemented by organizational information systems. The identification of authorized users of the information system and the specification of access privileges reflects the requirements in other security controls in the security plan. Users requiring administrative privileges on information system accounts receive additional scrutiny by appropriate organizational personnel (e.g., system cowner, screeive additional scrutiny by appropriate organizational personnel (e.g., system owner, mission/business owner, or chief information security officer) responsible for approving such accounts and privileged access. Organizations may choose to define access privileges or other attributes by account, by type of account, or a combination of both. Other artitutures required for authorizing access include, for example, restrictions on time-of-day, day-of-week, and point-of-origin. In defining other account attributes, organizations consider system-related requirements (e.g., time zone differences, customer requirements, remote access to support travel requirements), Failure to consider these factors could affect information system availability. Temperary accounts are accounts intended for short-term use. Organizations establish temporary accounts are accounts intended for short-term use. Organizations establish temporary accounts are accounts intended procedures when there is a need for short-term accounts without the demand for immediacy in account activation. Organizations establish mergency accounts are accounts activation may bypass normal account activation accounts (e.g., local mergency and attemporary accounts are necessary and accounts accounts activation may bypass normal account activation. Therefore, emergency accounts activation may bypass normal account activation accounts (e.g., local counts remaind available and are not subject to automatic disabling or removal dates. Conditions for disabling or decrivating accounts include, for example: (i) when attended	6,Mc1,Mc1,Mc1,Mc1,Mc1,Mc1,Mc1,Mc1,Mc1,Mc1					
AC-2 (1)	2	Access Control Account Management Automated System Account Management		The organization employs automated mechanisms to support the management of information system accounts.	The use of automated mechanisms can include, for example: using email or text messaging to automatically notify account managers when users are terminated or transferred; using the information system to manitor account usage; and using telephonic notification to report atypical system account usage.				x	х	
AC-2 (2)		Access Control Account Management Removal of Temporary / Emergency Accounts		The information system automatically [Selection: removes; disables] temporary and emergency accounts after [Assignment: organization-defined time period for each type of account].	This control enhancement requires the removal of both temporary and emergency accounts automatically after a predefined period of time has elapsed, rather than at the convenience of the systems administrator.				Х	Х	
AC-2 (3)	2	Access Control Account Management Disable Inactive Accounts		The information system automatically disables inactive accounts after [Assignment: organization-defined time period].					х	х	
AC-2 (4)	2	Access Control Account Management Automated Audit Actions		aepinea time periodi. The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].		AU-2,AU-12			х	х	
AC-2 (5)	2	Access Control Account Management Inactivity Logout		The organization requires that users log out when [Assignment: organization-defined time-period of expected inactivity or description of when to log out].		SC-23				х	
AC-2 (6)	2	Access Control Account Management Dynamic Privilege Management		The information system implements the following dynamic privilege management capabilities: [Assignment: organization-defined list of dynamic privilege management capabilities].	In contrast to conventional access control approaches which employ static information system accounts and predefined sets of user privileges, dynamic access control approaches (e.g., service-oriented architectures) rely on run time access control decisions facilitated by dynamic privilege management. While user identities may remain relatively constant over time, user privileges may change more frequently based on ongoing mission/business requirements and operational needs of organizations. Dynamic privilege management con include, for example, the immediate revocation of privileges from users, as apposed to requiring that users terminate and restart their sessions to reflect any changes in privileges of users based on dynamic rules as apposed to editing specific user profiles. This type of privileges and on dynamic rules are applied to the privileges of users based on dynamic rules are opposed to editing specific user profiles. This type of privilege management includes, for example, automatic adjustments of privileges disease or in emergency maintenance situations. This control enhancement also includes the ancillary effects of privilege changes, for example, the potential changes to encryption keys used for communications. Dynamic privilege management can support requirements for information system resiliency.	AC-16

					applications and services in support of organizational missions and business operations,	3,MA-4,MA-5,PE-3					
					access enforcement mechanisms can also be employed at the application and service level to provide increased information security.						
					to provide increased information security.						
AC-3 (1)	2	Access Control Access Enforcement Restricted	X								[Withdrawn: Incorporated into AC-6]
		Access to Privileged Functions									
AC-3 (2)	2	Access Control Access Enforcement Dual		The information system enforces dual authorization for [Assignment: organization-defined	Dual authorization mechanisms require the approval of two authorized individuals in order	CP-9,MP-6					
		Authorization		privileged commands and/or other organization-defined actions].	to execute. Organizations do not require dual authorization mechanisms when immediate responses are necessary to ensure public and environmental safety. Dual authorization						
					may also be known as two-person control.						
AC-3 (3)	2	Access Control Access Enforcement Mandatory		The information system enforces [Assignment: organization-defined mandatory access control	Mandatory access control as defined in this control enhancement is synonymous with	AC-25,SC-11					
		Access Control		policy] over all subjects and objects where the policy: (a) Is uniformly enforced across all subjects and objects within the boundary of the information	nondiscretionary access control, and is not constrained only to certain historical uses (e.g., implementations using the Bell-LaPadula Model). The above class of mandatory access control						
				system:	policies constrains what actions subjects can take with information obtained from data objects						
				(b) Specifies that a subject that has been granted access to information is constrained from doing	for which they have already been granted access, thus preventing the subjects from passing the						
				any of the following;	information to unauthorized subjects and objects. This class of mandatory access control policies						
				(b)(1) Passing the information to unauthorized subjects or objects;	also constrains what actions subjects can take with respect to the propagation of access control privileges; that is, a subject with a privilege cannot pass that privilege to other subjects. The						
				(b)(2) Granting its privileges to other subjects;	policy is uniformly enforced over all subjects and objects to which the information system has						
				(b)(3) Changing one or more security attributes on subjects, objects, the information system, or information system components;	control. Otherwise, the access control policy can be circumvented. This enforcement typically is						
				(b)(4) Choosing the security attributes and attribute values to be associated with newly created or	provided via an implementation that meets the reference monitor concept (see AC-25). The policy						
				modified objects; or	is bounded by the information system boundary (i.e., once the information is passed outside of the control of the system, additional means may be required to ensure that the constraints on the						
				(b)(5) Changing the rules governing access control; and	information remain in effect). The trusted subjects described above are granted privileges						
				(c) Specifies that [Assignment: organization-defined subjects] may explicitly be granted	consistent with the concept of least privilege (see AC-6). Trusted subjects are only given the						
]		[Assignment: organization-defined privileges (i.e., they are trusted subjects)] such that they are not limited by some or all of the above constraints.	minimum privileges relative to the above policy necessary for satisfying organizational						
]			mission/business needs. The control is most applicable when there is some policy mandate (e.g., law, Executive Order, directive, or regulation) that establishes a policy regarding access to						
]			sensitive/classified information and some users of the information system are not authorized						
					access to all sensitive/classified information resident in the information system. This control can						
]			operate in conjunction with AC-3 (4). A subject that is constrained in its operation by policies						
					governed by this control is still able to operate under the less rigorous constraints of AC-3 (4), but policies governed by this control take precedence over the less rigorous constraints of AC-3 (4).						
					For example, while a mandatory access control policy imposes a constraint preventing a subject						
					from passing information to another subject operating at a different sensitivity label, AC-3 (4)						
					permits the subject to pass the information to any subject with the same sensitivity label as the						
					subject.						
AC-2/41	2	Access Control Access Enforcement		The information system enforces [Assignment: organization-defined discretionary access control	When discretionary access control policies are implemented, subjects are not constrained						
AC-3 (4)	'	Discretionary Access Control		policy] over defined subjects and objects where the policy specifies that a subject that has been	with regard to what actions they can take with information for which they have already						
		,,		granted access to information can do one or more of the following:	been granted access. Thus, subjects that have been granted access to information are not						
				(a) Pass the information to any other subjects or objects;	prevented from passing (i.e., the subjects have the discretion to pass) the information to						
				(b) Grant its privileges to other subjects;	other subjects or objects. This control enhancement can operate in conjunction with AC-3						
				(c) Change security attributes on subjects, objects, the information system, or the information	(3). A subject that is constrained in its operation by policies governed by AC-3 (3) is still able						
				system's components; (d) Choose the security attributes to be associated with newly created or revised objects; or	to operate under the less rigorous constraints of this control enhancement. Thus, while AC- 3 (3) imposes constraints preventing a subject from passing information to another subject						
				(d) Choose the security attributes to be associated with newly created or revised objects; or (e) Change the rules governing access control.	(3) imposes constraints preventing a subject from passing information to another subject operating at a different sensitivity level, AC-3 (4) permits the subject to pass the						
					information to any subject at the same sensitivity level. The policy is bounded by the						
					information system boundary. Once the information is passed outside of the control of the						
					information system, additional means may be required to ensure that the constraints						
					remain in effect. While the older, more traditional definitions of discretionary access						
					control require identity-based access control, that limitation is not required for this use of discretionary access control.						

								_			
Control ID AC-3 (5)	2	Control Name Witho Access Control Access Enforcement Security-Relevant Information	rawn	Control Text The information system prevents access to [Assignment: organization-defined security-relevant information] except during secure, non-operable system states.	Supplemental Guidance Security-relevant information is any information within information systems that can potentially impact the operation of security functions or the provision of security services in a manner that could result in failure to enforce system security policies or maintain the isolation of code and dato. Security-relevant information includes, for example, filtering rules for routers/firewalls, cryptographic key management information, configuration parameters for security services, and access control lists. Secure, non-operable system states include the times in which information systems are not performing mission/business- related processing (e.g., the system is off-line for maintenance, troubleshooting, boot-up, shut down).	Related Controls CM-3	Priority	Low	Mod	High	Notes
AC-3 (6)	2	Access Control Access Enforcement Protection	X		,						[Withdrawn: Incorporated into MP-4 and SC-28]
AC-3 (7)		of User and System Information Access Control Access Enforcement Role-Based		The information system enforces a role-based access control policy over defined subjects and	Role-based access control (RBAC) is an access control policy that restricts information						/
ACS (7)	2	Access Control Access Control		The injointuluit system explices of une-obsequences control points over unjined subjects and outlined scores based upon [Assignment: organization-defined roles and users outhorized to assume such roles].	system access to authorized users. Circuitations on create specific roles based on job functions and the authorized users. Circuitations can create specific roles based on job functions and the authorizations (i.e., privileges) to perform needed operations on organizational information systems associated with the organization-defined roles. When users are assigned to the organizational roles, they inherit the authorizations or privileges defined for those roles. RBAS campilities privilege administration for organizations because privileges are not assigned directly to every user (which can be a significant number of individuols for mid- to large-size organizations) but are instead acquired through role assignments. RBAS can be implemented either as a mandatory or discretionary form of access control. For organizations implementing RBAS with mandatory access controls, the requirements in AC-3 (3) define the scope of the subjects and objects covered by the policy.						
AC-3 (8)	2	Access Control Access Enforcement Revocation of Access Authorizations		The information system enforces the revocation of access authorizations resulting from changes to the security attributes of subjects and objects based on [Assignment: organization-defined rules governing the timing of revocations of access authorizations].	Revocation of access rules may differ based on the types of access revoked. For example, if a subject (i.e., user or process) is removed from a group, access may not be revoked until the next time the object (e.g., file) is opened or until the next time the subject attempts a new access to the object. Revocation based on changes to security labels may take effect immediately. Organizations can provide alternative approaches on how to make revocations immediate if information systems cannot provide such capability and immediate revocation is necessary.						
AC-3 (9)	2	Access Enforcement Controlled Release		The information system does not release information outside of the established system boundary unless: (a) The receiving [Assignment: organization-defined information system or system component] provides [Assignment: organization-defined security safeguards]; and (b) [Assignment: organization-defined security safeguards] are used to validate the appropriateness of the information designated for release.	Information systems can only protect arganizational information within the confines of established system boundaries. Additional security subgrourds may be needed to ensure that such information is adequately protected once it is passed beyond the established information system boundaries. Examples of information leaving the system boundaries. Examples of information system or printing the information in clude transmitting information to an external information system or printing the information on one of its printers to cases where the information system is unable to make a determination of the adequacy of the protections provided by entities outside its boundary, as a mitigating control, organizations determine procedurally whether the external information systems are providing adequate security. The means used to determine the adequacy of the security provided by external information systems are provided information systems are provided information systems include, for example, conducting inspections or periodic testing, establishing agreements between the organization and sits counterpart organizations, or some other process. The means used by external entities to protect the information received need not be the same as the same used by the organization, but the means employed are sufficient to provide consistent objection of the security policy to protect the information. This control enhancement required information systems to employ technical or procedural means to validate the information prior to releasing it to external systems. For example, if the information system passes information to relative statistics associated with the exported information are oppropriate for the receiving system. Alternatively, if the information system passes information to a printer in organization controlled by another organization, technical means are employed to validate that the security uttributes associated with the exported information are oppropriate for the receiving system. Here the same policy reporting access t						
AC-3 (10)	2	Access Control Access Enforcement Audited Override of Access Control Mechanisms		The organization employs an audited override of automated access control mechanisms under [Assignment: organization-defined conditions].		AU-2,AU-6					
AC-4	1	Access Control Information Flow Enforcement		The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	information flow control regulates where information is allowed to travel within an information system and between information systems (as opposed to who is allowed to access the information system and between information systems (as opposed to who is allowed to access the information and without explicit legard to subsequent accesses to that information. Flow control restrictions that the control restrictions are supported to the information. Flow control restrictions that the control restriction is the information of the information that information control restrictions are supported by the control restriction who requests to the interest that are not from the internal web proxy sever, and limiting information transfers between organizations based on data structures and content. AC-4 (1)	2	Control Name W Access Control Information Flow Enforcement Object Security Attributes	Vithdrawn	Control Text The information system uses [Assignment: organization-defined security attributes] associated with [Assignment: organization-defined information, source, and destination objects] to enforce [Assignment: organization-defined information flow control policies] as a basis for flow control decisions.	Supplemental Catidance Information flow enforcement mechanisms compare security attributes associated with Information flow enforcement mechanisms compare security attributes associated with Information (data content and data structure) and source/destination objects, and respond appropriately (e.g., black, quarantina, olert administrator) when the mechanisms encounter information filows not explicitly allowed by information flow policies. For example, an information object labeled secret, but an information object tabeled are psecret would not be allowed to flow to a destination object labeled Secret. Security attributes can also include, for example, source and destination addresses employed in traffic filter firewalls. Flow enforcement using explicit security attributes can be used, for example, to control the release of certain types of information.	Related Controls AC-16	Priority L	ow Moo	High	in Not	es .
AC-4 (2)	2	Access Control Information Flow Enforcement Processing Domains		The information system uses protected processing domains to enforce [Assignment: organization- defined information flow control policies] as a basis for flow control decisions.	Within information systems, protected processing domains are processing spaces that have controlled interactions with other processing spaces, thus enabling contrated in finamation flows between these spaces and to/from data/information objects. A protected processing domain can be provided, for example, by implementing domain and type enforcement. In domain and supe enforcement, information system processes are assigned to domains; information is identified by types; and information flows are controlled based on allowed information accesses (determined by domain and type), allowed signaling among domains, and allowed process transitions to other domains.						
AC-4 (3)	2	Access Control Information Flow Enforcement Dynamic Information Flow Control		The information system enforces dynamic information flow control based on [Assignment: organization-defined policies].	Organizational policies regarding dynamic information flow control include, for example, allowing or disallowing information flows based on changing conditions or mission/operational considerations. Changing conditions include, for example, changes in organizational risk tolerance due to changes in the immediacy of mission/business needs, changes in the threat environment, and detection of potentially harmful or adverse events.	51-4					
AC-4 (4)	2	Access Control Information Flow Enforcement Content Check Encrypted Information		The information system prevents encrypted information from bypassing content-checking mechanisms by [Selection (nane or more): decrypting the information; blocking the flow of the encrypted information; terminating communications sessions attempting to pass encrypted information; [Assignment: organization-defined procedure or method]].		SI-4					
AC-4 (5)		Access Control Information Flow Enforcement Embedded Data Types		The information system enforces [Assignment: organization-defined limitations] on embedding data types within other data types.	Embedding data types within other data types may result in reduced flow control effectivenes. Data type embedding includes, for example, inserting executable files as objects within word processing files, inserting references or descriptive information into a media file, and compressed or archived data types that may include multiple embedded data types. Limitations on data type embedding consider the levels of embedding and prohibit levels of data type embedding that are beyond the capability of the inspection tools.						
AC-4 (6)	2	Access Control Information Flow Enforcement Metadata		The information system enforces information flow control based on [Assignment: organization-defined metadata].	Metadata is information used to describe the characteristics of data. Metadata can include structural metadata describing data structural enter data describing data structural services, and semantics) or descriptive metadata describing data contents (e.g., age, location, telephone number). Enforcing allowed information flows based on metadata enables simpler and more effective flow control. Organizations consider the trustworthises of metadata with regard to data occuracy (i.e., knowledge that the metadata values are correct with respect to the data), data integrity (i.e., protecting against unauthorized changes to metadata tags), and the binding of metadata to the data poyload (i.e., ensuring sufficiently strong binding techniques with appropriate levels of assurance).	AC-16,SI-7					
AC-4 (7)	2	Access Control Information Flow Enforcement One-Way Flow Mechanisms		The information system enforces [Assignment: organization-defined one-way information flows] using hardware mechanisms.							
AC-4 (8)	2	Access Control Information Flow Enforcement Security Policy Filters		The information system enforces information flow control using (Assignment: organization-defined security policy filters) as a basis for flow control decisions for [Assignment: organization-defined information flows].	Organization-defined security policy filters can address data structures and content. For example, security policy filters for data structures can check for maximum file lengths, maximum file laises, and data filty leyes (flor structured and unstructured data). Security policy filters for data content can check for specific words (e.g., dirty/clean word filters), enumerated values or adata value ranges, and hidden content. Structured data permits the interpretation of data content by applications. Unstructured data typically refers to digital information without a particular data structure on with a data structure that does not facilitate the development of rule sets to address the particular sensitivity of the information conveyed by the data or the associated flow enforcement decisions. Unstructured data consists of; (i) birmap objects that are inherently non language-based (i.e., image, video, or audio files); and (ii) textual objects that are based on written or printed languages (e.g., commercial off-the-shelf word processing documents, spreadsheets, or emails). Organizations can implement more than one security policy filter to meet information flow control objectives (e.g., employing clean word lists in conjunction with dirty word lists may help to reduce false positives).						
AC-4 (9)	2	Access Control Information Flow Enforcement Human Reviews		The information system enforces the use of human reviews for [Assignment: organization-defined information flows] under the following conditions: [Assignment: organization-defined conditions].	Organizations define security policy filters for all situations where automated flow control decisions are possible. When a fully automated flow control decision is not possible, then a human review may be employed in lieu of, or as a complement to, automated security policy filtering. Human reviews may also be employed as deemed necessary by organizations.						
AC-4 (10)		Access Control Information Flow Enforcement Enable / Disable Security Policy Filters		The information system provides the copability for privileged administrators to enable/disable [Assignment: organization-defined security policy filters] under the following conditions: [Assignment: organization-defined conditions].	For example, as allowed by the information system authorization, administrators can enable security policy filters to accommodate approved data types.						
AC-4 (11)	2	Access Control Information Flow Enforcement Configuration of Security Policy Filters		The information system provides the capability for privileged administrators to configure [Assignment: organization-defined security policy filters] to support different security policies.	For example, to reflect changes in security policies, administrators can change the list of 'dirty words' that security policy mechanisms check in accordance with the definitions provided by organizations.						
AC-4 (12)	2	Access Control Information Flow Enforcement Data Type Identifiers		The information system, when transferring information between different security domains, uses [Assignment: organization-defined data type identifiers] to validate data essential for information flow decisions.							
AC-4 (13)	2	Access Control Information Flow Enforcement Decomposition Into Policy-Relevant Subcomponents		The information system, when transferring information between different security domains, decomposes information into [Assignment: organization-defined policy-relevant subcomponents] for submission to policy enforcement mechanisms.	Policy enforcement mechanisms apply filtering, inspection, and/or sanitization rules to the policy-relevant subcomponents of information to facilitate flow enforcement prior to transferring such information to different security domains. Parsing transfer files facilitates policy decisions on source, destination, certificates, classification, attachments, and other security-related component differentiators.						
AC-4 (14)	2	Access Control Information Flow Enforcement Security Policy Filter Constraints		The information system, when transferring information between different security domains, implements [Assignment: organization-defined security policy filters] requiring fully enumerated formats that restrict data structure and content.	Data structure and content restrictions reduce the range of potential malicious and/or unsanctioned content in cross-domain transactions. Security policy filters that restrict data structures include, for example, restricting file sizes and field lengths. Data content policy filters include, for example: (i) encoding formats for character sets (e.g., Universal Character Set Transformation Formas, American Standard Code for Information Interchange); (ii) restricting character data fields to only contain alpha-numeric characters; (iii) prohibiting special characters; and (iv) validating schema structures.

AC-4 (15)	2	Access Control Information Flow Enforcement	Withdrawn	The information system, when transferring information between different security domains,		SI-3	PHOHITY	LOW MOG	High	Notes
		Detection of Unsanctioned Information		examines the information for the presence of [Assignment: organized-defined unsanctioned information] and prohibits the transfer of such information in accordance with the [Assignment: organization-defined security policy].	be transferred for malicious code and dirty words.					
AC-4 (16)	2	Access Control Information Flow Enforcement Information Transfers on Interconnected Systems	X							[Withdrawn: Incorporated into AC-4]
AC-4 (17)	2	Access Control Information Flow Enforcement Domain Authentication		The information system uniquely identifies and authenticates source and destination points by [Selection (ane or more): organization, system, application, individual) for information transfer.	Attribution is a critical component of a security concept of operations. The obility to identify source and destination points for information flowing in information systems, allows the feronsic reconstruction of events when required, and encourages policy compliance by attributing policy violations to specific organizations/individuals. Successful domain authentication requires that information system labels distinguish among systems, organizations, and individuals involved in preparing, sending, receiving, or disseminating information.	IA-2,IA-3,IA-4,IA-5				
AC-4 (18)	2	Access Control Information Flow Enforcement Security Attribute Binding		The information system binds security attributes to information using [Assignment: organization-defined binding techniques] to facilitate information flow policy enforcement.	Binding techniques implemented by information systems affect the strength of security attribute binding to information. Binding strength and the assurance associated with binding techniques play on important part in the trust organizations have in the information flow enforcement process. The binding techniques affect the number and degree of additional reviews required by organizations.	AC-16,5C-16				
AC-4 (19)		Access Control Information Flow Enforcement Validation of Metadata		The information system, when transferring information between different security domains, applies the same security policy filtering to metadata as it applies to data payloads.	This control enhancement requires the validation of metadata and the data to which the metadata applies. Some organizations distinguish between metadata and ada to a which the metadata is bound. Other organizations do not make such distinctions, considering metadata and the data to which the metadata applies as part of the payload. All information (including metadata and the data to which the metadata applies is subject to filtering and inspection.					
AC-4 (20)	2	Access Control Information Flow Enforcement Approved Solutions		The organization employs [Assignment: organization-defined solutions in approved configurations] to control the flow of [Assignment: organization-defined information] across security domains.	Organizations define approved solutions and configurations in cross-domain policies and guidance in accordance with the types of information flows across classification boundaries. The Unified Cross Domain Management Office (UCDMO) provides a baseline					
AC-4 (21)	2	Access Control Information Flow Enforcement Physical / Logical Separation of Information Flows		The information system separates information flows logically or physically using [Assignment: organization-defined mechanisms and/or techniques] to accomplish [Assignment: organization-defined required separations by types of information].	listing of approved cross-domain solutions. Enforcing the separation of information flows by type can enhance protection by ensuring that information is not commingled while in transit and by enabling flow control by transmission paths perhaps not otherwise achievable. Types of separable information include, for example, indownd and outbound communications traffic, service requests and responses, and information of differing security categories.					
AC-4 (22)	2	Access Control Information Flow Enforcement Access Only		The information system provides access from a single device to computing platforms, applications, or data residing on multiple different security domains, while preventing any information flow between the different security domains.	The information system, for example, provides a desktop for users to access each connected security domain without providing any mechanisms to allow transfer of information between the different security domains.					
AC-5	1	Access Control Separation of Duties		The organization: a. Separates [Assignment: organization-defined duties of individuals]; b. Documents separation of duties of individuals; and c. Defines information system access authorizations to support separation of duties.	Separation of duties addresses the potential for abuse of authorized privileges and helps to	AC-3,AC-6,PE-3,PE- 4,PS-2	P1	x	х	
AC-6	1	Access Control Least Privilege		The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	Organizations employ least privilege for specific duties and information systems. The principle of least privilege is also applied to information system processes, ensuring that the processes operate at privilege levels no higher than necessary to accomplish required organizational missions/business functions. Organizations consider the creation of additional processes, roles, and information system accounts as necessary, to achieve least privilege. Organizations also apply least privilege to the development, implementation, and operation of organizational information systems.	AC-2,AC-3,AC-5,CM- 6,CM-7,PL-2	P1	x	х	
AC-6 (1)	2	Access Control Least Privilege Authorize Access to Security Functions		The organization explicitly authorizes access to [Assignment: organization-defined security functions (deployed in hardware, software, and firmware) and security-relevant information].	authorizations (i.e., permissions, privileges), setting events to be audited, and setting intrusion detection parameters. Security-relevant information includes, for example, filtering rules for routers/firevalls, cryptographic key management information, configuration parameters for security servives, and access control lists. Explicitly authorized personnel include, for example, security administrators, system and network administrators, system security officers, system minitenance personnel, system programmers, and other privileged users.	AC-17,AC-18,AC-19		х	Х	
AC-6 (2)		Access Control Least Privilege Non-Privileged Access for Nonsecurity Functions		The organization requires that users of information system accounts, or roles, with access to [Assignment: organization-defined security functions or security-relevant information], use non- privileged accounts or roles, when accessing nonsecurity functions.	This control enhancement limits exposure when operating from within privileged accounts or roles. The inclusion of roles addresses situations where organizations implement occess control policies such as role-based access control and where a change of role provides the same degree of assurance in the change of access authorizations for both the user and all processes acting on behalf of the user as would be provided by a change between a privileged and non-privileged account.			x	X	
AC-6 (3)	2	Access Control Least Privilege Network Access to Privileged Commands		The organization authorizes network access to [Assignment: organization-defined privileged commands] only for [Assignment: organization-defined compelling operational needs] and documents the rationale for such access in the security plan for the information system.	Network access is any access across a network connection in lieu of local access (i.e., user being physically present at the device).	AC-17			X	
AC-6 (4)		Access Control Least Privilege Separate Processing Domains		The information system provides separate processing domains to enable finer-grained allocation of user privileges.	Providing separate processing domains for finer-grained allocation of user privileges includes, for example: (i) using virtualization techniques to allow additional privileges within a virtual machine while restricting privileges to other virtual machines or to the underlying actual machine; (ii) employing hardware and/or software domain separation mechanisms; and (iii) implementing separate physical domains.	AC-4,SC-3,SC-30,SC- 32				
AC-6 (5)	2	Access Control Least Privilege Privileged Accounts		The organization restricts privileged accounts on the information system to [Assignment: organization-defined personnel or roles].	Privileged accounts, including super user accounts, are typically described as system administrator for various types of commercial off-the-shelf operating systems. Restricting privileged accounts to specific personnel or roles prevents day-to-day users from having access to privileged information/functions. Organizations may differentiate in the application of this control enhancement between allowed privileges for local accounts and for domain accounts provided organizations retain the ability to control information system configurations for key security parameters and as otherwise necessary to sufficiently mitigate risk.	CM-6		x T	x	
AC-6 (6)	2	Access Control Least Privilege Privileged Access		The organization prohibits privileged access to the information system by non-organizational		IA-8				
		by Non-Organizational Users		users.						1

AC-6 (7)	2	Access Control Least Privilege Review of User	Withdrawn	Control Text The organization:	Supplemental Guidance The need for certain assigned user privileges may change over time reflecting changes in	Related Controls CA-7	Priority	LOW	WICIG	nigh	Notes
		Privileges		(a) Reviews [Assignment: organization-defined frequency] the privileges assigned to [Assignment:	organizational missions/business function, environments of operation, technologies, or						
				organization-defined roles or classes of users] to validate the need for such privileges; and	threat. Periodic review of assigned user privileges is necessary to determine if the rationale for assigning such privileges remains valid. If the need cannot be revalidated, organizations						
				(b) Reassigns or removes privileges, if necessary, to correctly reflect organizational mission/business needs.	take appropriate corrective actions.						
AC-6 (8)	2	Access Control Least Privilege Privilege Levels		The information system prevents [Assignment: organization-defined software] from executing at							
1		for Code Execution		higher privilege levels than users executing the software.	privileges to perform required functions. However, if the privileges required for execution are at a higher level than the privileges assigned to organizational users invoking such						
1					applications/programs, those users are indirectly provided with greater privileges than						
					assigned by organizations.						
AC-6 (9)	2	Access Control Least Privilege Auditing Use of Privileged Functions		The information system audits the execution of privileged functions.	Misuse of privileged functions, either intentionally or unintentionally by authorized users, or by unauthorized external entities that have compromised information system accounts,	AU-2			x	х	
		Privilegea Functions			is a serious and ongoing concern and can have significant adverse impacts on						
					organizations. Auditing the use of privileged functions is one way to detect such misuse,						
					and in doing so, help mitigate the risk from insider threats and the advanced persistent						
AC-6 (10)	2	Access Control Least Privilege Prohibit Non-		The information system prevents non-privileged users from executing privileged functions to	threat (APT). Privileged functions include, for example, establishing information system accounts,				x	Х	
'''		Privileged Users from Executing Privileged		include disabling, circumventing, or altering implemented security safeguards/countermeasures.	performing system integrity checks, or administering cryptographic key management

Control ID AC-12		Control Name Withdra Access Control Session Termination		ates a user session after [Assignment: organization-	Supplemental Guidance This control addresses the termination of user-initiated logical sessions in contrast to SC-10		Priority L	ow Mod	High	Notes
AC-12	•	ACCESS CONTON Session Termination	the inclination system automatically retining defined conditions or trigger events requiring:		which addresses the termination of network connections that are associated with communications sessions (i.e., network disconnect). A logical session (for local, network, and remote access) is initiated whenever a user (or process acting no health of a user) accesses an organizational information system. Such user sessions can be terminated (and thus terminate user access) without terminating networks sessions. Session termination terminates all processes associated with a user's logical session except those processes that are specifically created by the user (i.e., session owner) to continue after the session is terminated. Conditions or trigger events requiring automatic session termination can include, for example, organization-defined periods of user inactivity, targeted responses to certain types of incidents, time-of-day restrictions on information system use.	30-10,50-25	r 2		^	
AC-12 (1)		Access Control Session Termination User- Initiated Logouts / Message Displays	The information system: (a) Provides a logaut capability for user-initial authentication is used to gain access to [Assig resources]; and (b) Disploys an explicit logaut message to use authenticated communications sessions.	gnment: organization-defined information	Information resources to which users gain access via authentication include, for example, local workstations, databases, and passwork-protected websites/web-based services. Lagout messages for web page access, for example, can be displayed after authenticated sessions have been terminated. However, for some types of interactive sessions including, for example, filt transfer protace (IFTP) sessions, information systems typically send logout messages as final messages prior to terminating sessions.					
AC-13	1	Access Control Supervision and Review - Access								[Withdrawn: Incorporated into AC-2 and AU-6]
AC-14	1	Access Control Permitted Actions Without Identification or Authentication	missions/business functions; and	authentication consistent with organizational ale in the security plan for the information system,	This control addresses situations in which organizations determine that no identification or authentication is required in organizational information systems. Organizations may allow a limited number of user actions without identification or authentication including, for example, when individuals access public websites or other publicly accessible federal information systems, when individuals use mobile phones to receive calls, or when facsimiles are received. Organizations also identify actions that normally require identification or authentication but may under certain circumstances (e.g., emergencies), allow identification or authentication but may under certain circumstances (e.g., emergencies), allow identification or authentication mechanisms to be bypassed. Such bypasses may occur, for example, via a software-readable physical switch that commands bypasse of the logon functionality and is protected from accidental or unmonitored use. This control does not apply to situations where identification and authentication have already occurred and are not repeated, but rather to situations where identification and authentication have not yet occurred. Organizations may decide that there are no user actions that can be performed on organizational information systems without identification and authentication and thus, the values for assignment statements can be none.	CP-2,IA-2	рз х	x	x	
AC-14 (1)	2	Access Control Permitted Actions Without Identification or Authentication Necessary Uses								[Withdrawn: Incorporated into AC-14]
AC-15	1	Access Control Automated Marking								[Withdrawn: Incorporated into MP-3]
		Access Control Security Attributes	having (Assignment: organization-defined sect process, and/or in transmission; b. Ensures that the security attribute associati c. 					Organizations establish agreements and processes to ensure that all distributed						
					information system components implement security attributes with consistent interpretations in automated access/flow enforcement actions.						
					interpretations in automated access/flow enjorcement actions.						
AC-16 (8)	2	Access Control Security Attributes Association		The information system implements [Assignment: organization-defined techniques or	The association (i.e., binding) of security attributes to information within information						
		Techniques / Technologies		technologies] with [Assignment: organization-defined level of assurance] in associating security attributes to information.	systems is of significant importance with regard to conducting automated access enforcement and flow enforcement actions. The association of such security attributes can						
					be accomplished with technologies/techniques providing different levels of assurance. For						
					example, information systems can cryptographically bind security attributes to information using digital signatures with the supporting cryptographic keys protected by hardware						
					devices (sometimes known as hardware roots of trust).						
AC-16 (9)	2	Access Control Security Attributes Attribute		The organization ensures that security attributes associated with information are reassigned only	Validated re-grading mechanisms are employed by organizations to provide the requisite						
AC-10 (3)	-	Reassignment Access Control Security Attributes Attribute		via re-grading mechanisms validated using [Assignment: organization-defined techniques or	levels of assurance for security attribute reassignment activities. The validation is						
				procedures].	facilitated by ensuring that re-grading mechanisms are single purpose and of limited						
					function. Since security attribute reassignments can affect security policy enforcement actions (e.g., access/flow enforcement decisions), using trustworthy re-grading						
					mechanisms is necessary to ensure that such mechanisms perform in a consistent/correct						
AC-16 (10)	2	Access Control Security Attributes Attribute		The information system provides authorized individuals the capability to define or change the type	mode of operation. The content or assigned values of security attributes can directly affect the ability of			_	_		
AC-10 (10)	2	Configuration by Authorized Individuals		and value of security attributes available for association with subjects and objects.	individuals to access organizational information. Therefore, it is important for information						
					systems to be able to limit the ability to create or modify security attributes to authorized						
AC-17	1	Access Control Remote Access		The organization:	individuals only. Remote access is access to organizational information systems by users (or processes acting	AC-2,AC-3.AC-18.AC-	P1 X	,	×	x	
	-			a. Establishes and documents usage restrictions, configuration/connection requirements, and	on behalf of users) communicating through external networks (e.g., the Internet). Remote	19,AC-20,CA-3,CA-	- ^	ľ			
				implementation guidance for each type of remote access allowed; and	access methods include, for example, dial-up, broadband, and wireless. Organizations often						
				b. Authorizes remote access to the information system prior to allowing such connections.	employ encrypted virtual private networks (VPNs) to enhance confidentiality and integrity over remote connections. The use of encrypted VPNs does not make the access non-remote;	8,MA-4,PE-17,PL- 4,SC-10,SI-4					
					however, the use of VPNs, when adequately provisioned with appropriate security controls	,,					
					(e.g., employing appropriate encryption techniques for confidentiality and integrity protection) may provide sufficient assurance to the organization that it can effectively treat						
					such connections as internal networks. Still, VPN connections traverse external networks,						
					and the encrypted VPN does not enhance the availability of remote connections. Also, VPNs						
					with encrypted tunnels can affect the organizational capability to adequately monitor network communications traffic for malicious code. Remote access controls apply to						
					information systems other than public web servers or systems designed for public access.						
					This control addresses authorization prior to allowing remote access without specifying the						
					formats for such authorization. While organizations may use interconnection security agreements to authorize remote access connections, such agreements are not required by						
					this control. Enforcing access restrictions for remote connections is addressed in AC-3.						
AC-17 (1)	2	Access Control Remote Access Automated		The information system monitors and controls remote access methods.	Automated monitoring and control of remote access sessions allows organizations to	AU-2,AU-12		,	х .	х	
		Monitoring / Control			detect cyber attacks and also ensure ongoing compliance with remote access policies by auditing connection activities of remote users on a variety of information system						
					components (e.g., servers, workstations, notebook computers, smart phones, and tablets).

AC-25	1	Access Control Reference Monitor	The information system implements a reference monitor for [Assignment: organization-defined access control policies] that is tamperproof, always invoked, and small enough to be subject to analysis and testing, the completeness of which can be assured.	Information is represented internally within information systems using abstractions known as data structures. Internal data structures can represent different types of entities, both active and passive. Active entities, also known as subjects, are typically associated with individuals, devices, or processes acting on behalf of individuals. Passive entities, also known as subjects, are typically associated with data structures such as records, buffers, tables, files, inter-process pipes, and communications ports. Reference monitors typically enforce mandatory access control policies* at yope of access control bar testricts access to objects based on the identity of subjects or groups to which the subjects belong. The access control sare mandatory because subjects with certain privileges (i.e., access permissions) are restricted from passing those privileges on to any other subjects, ethier directly or indirectly that is, the information system strictly enforces the access control policy based on the rule set established by the policy. The tamperproof property of the reference monitor prevents adversaries from compromising the functioning of the mechanism. The always invoked property prevents adversaries from bypassing the mechanism and hence violating the security policy. The smallness property helps to ensure the completeness in the analysis and testing of the mechanism to detect weaknesses or deficiencies (i.e., latent flaws) that would prevent the enforcement of the security policy. AP	0	Authority and Purpose						[Privacy Controls]
AP-1	1	Authority and Purpose Authority to Collect	The organization determines and documents the legal authority that permits the collection, use, maintenance, and sharing of personally identifiable information (PII), either generally or in support of a specific program or information system need.	Before collecting PII, the organization determines whether the contemplated collection of PII is legally authorized. Program officials consult with the Senior Agency Official for Privacy (SAOP)/Chief Privacy Officer (CPO) and legal counsel regarding the authority of any program or activity to collect PII. The authority to collect PII is documented in the System of Records Notice (SORN) and/or Privacy Impact Assessment (PIA) or other applicable documentation such as Privacy Act Statements or Computer Matching Agreements.	AR-2, DM-1, TR-1, TR- 2			[Privacy Controls]
AP-2	1	Authority and Purpose Purpose Specification	The organization describes the purpose(s) for which personally identifiable information (PII) is collected, used, maintained, and shared in its privacy notices.	statutory language is written broadly and thus subject to interpretation, organizations	AR-2, AR-4, AR-5, DM-1, DM-2, TR-1, TR-2, UL-1, UL-2			[Privacy Controls]
AR	0	Accountability, Audit, and Risk Management						[Privacy Controls]
AR-1		Accountability, Audit, and Risk Management Governance and Privacy Program	The organization: a. Appoints a Senior Agency Official for Privacy (SAOP)/Chief Privacy Officer (CPO) accountable for developing, implementing, and maintaining an organization-wide governance and privacy program to ensure compliance with all applicable laws and regulations regarding the collection, use, maintenance, sharing, and disposal of personally identifiable information [PID by programs and information systems; b. Monitors federal privacy laws and policy for changes that affect the privacy program; c. Allocates [Assignment: organization-defined allocation of budget and staffing] sufficient resources to implement and operate the organization-wide privacy program; d. Develops a strategic organizational privacy plan for implementing applicable privacy controls, policies, and procedures; e. Develops, disseminates, and implements operational privacy policies and procedures that gover the appropriate privacy and security controls for programs, information systems, or technologies involving Pil; and f. Updates privacy plan, policies, and procedures [Assignment: organization-defined frequency, at least biennially].	privacy. Accountability begins with the appointment of an SADP/CPO with the authority, mission, resources, and responsibility to develop and implement a multifacted privacy program. The SADP/CPO, in consultation with legal coursel, information security officials, and others as appropriate: (i) ensures the development, implementation, and enforcement of privacy policies and procedures; (ii) defined roles and responsibilities for protecting PIP, (iii) determines the level of information sensitivity with regard to PII holdings; (iv) identifies the laws, regulations, and internal policies that apply to the PIP; (iv) monitors privacy best practices; and (vi) monitors/audits compliance with identified privacy controls. To further accountability, the SADP/CPO develops privacy plans to document the privacy requirements of organizations all the privacy and security controls in place or planned for meeting those requirements. The plan serves as evidence of organizational privacy operations and supports resource requests by the SADP/CPO. A single plan or multiple plans may be necessary depending upon the organizational structures, requirements, and resources, and the plan(s) may vary in comprehensiveness. For example, a one-page privacy plan may cover privacy policies, documentation, and controls already in place, such as Privacy impact Assessments (PIA) and System of Records Notices (SORN). A comprehensive plan may include a baseline of privacy controls selected from this appendix and include. (I) processes for conducting privacy training an awareness requirements; (iv) requirements (iv) requirements (iv) (iv) plans for eliminating unnecessary PII holdings; and (vi) a framework for measuring annual performance goals and objectives for implementing identified privacy controls.				[Privacy Controls]
AR-2	1	Accountability, Audit, and Risk Management Privacy Impact and Risk Assessment	The organization: a. Documents and implements a privacy risk management process that assesses privacy risk to individuals resulting from the collection, sharing, storing, transmitting, use, and disposal of personally identifiable information (Pil); and b. Conducts Privacy Impact Assessments (PIAs) for information systems, programs, or other activities that pose a privacy risk in accordance with applicable law, OMB policy, or any existing organizational policies and procedures.	Organizational privacy risk management processes operate across the life cycles of all mission/business processes that collect, use, maintain, share, or dispose of PII. The tools and processes for managing risk are specific to organizational missions and resources. They include, but are not limited to, the conduct of PIAs. The PIAs both a process and the document that is the outcome of that process. OMB Memorandum 03-22 provides guidance to organizations for implementing the privacy provisions of the E-Government Act of 2002, including guidance on when PIAs are required for information systems. Some organizations may be required by law or policy to extend the PIA requirement to other activities involving PII or otherwise impacting privacy (e.g., programs, projects, or regulations). PIAs are conducted to identify privacy risks and identify methods to mitigate those risks. PIAs are also sconducted to ensure that programs or information systems comply with legal, regulatory, and policy requirements. PIAs also serve as notice to the public of privacy practices. PIAs are performed before developing or procuring information systems, or initiating programs or projects, that collect, use, maintain, or share PII and are updated when changes create new privacy risks.				[Privacy Controls]
AR-3	1	Accountability, Audit, and Risk Management Privacy Requirements for Contractors and Service Providers	The organization: a. Establishes privacy roles, responsibilities, and access requirements for contractors and service providers; and b. Includes privacy requirements in contracts and other acquisition-related documents.	Contractors and service providers include, but are not limited to, information providers, information processors, and other organizations providing information system development, information technology services, and other outsourced applications. Organizations consult with legal counsel, the Senior Agency Official for Privacy (SAOP)/Chief Privacy Officer (CPO), and contracting officers about applicable laws, directives, policies, or regulations that may impact implementation of this control. 					system/network administrators, personnel conducting configuration management and						
					auditing activities, personnel performing independent verification and validation activities.						
					security control assessors, and other personnel having access to system-level software,						
					adequate security-related technical training specifically tailored for their assigned duties.						
					Comprehensive role-based training addresses management, operational, and technical roles						
					and responsibilities covering physical, personnel, and technical safeguards and						
					countermeasures. Such training can include for example, policies, procedures, tools, and						
					artifacts for the organizational security roles defined. Organizations also provide the training						
					necessary for individuals to carry out their responsibilities related to operations and supply						
					chain security within the context of organizational information security programs. Role-						
					based security training also applies to contractors providing services to federal agencies.						
								_			
AT-3 (1)	2	Awareness and Training Role-Based Security		The organization provides [Assignment: organization-defined personnel or roles] with initial and	Environmental controls include, for example, fire suppression and detection	PE-1,PE-13,PE-14,PE-					
1		Training Environmental Controls		[Assignment: organization-defined frequency] training in the employment and operation of	devices/systems, sprinkler systems, handheld fire extinguishers, fixed fire hoses, smoke	15					
1				environmental controls.	detectors, temperature/humidity, HVAC, and power within the facility. Organizations						
1					identify personnel with specific roles and responsibilities associated with environmental						
					controls requiring specialized training.						
AT-3 (2)	2	Awareness and Training Role-Based Security		The organization provides [Assignment: organization-defined personnel or roles] with initial and		PE-2,PE-3,PE-4,PE-5					
		Training Physical Security Controls		[Assignment: organization-defined frequency] training in the employment and operation of	intrusion alarms, monitoring/surveillance equipment, and security guards (deployment and						
				physical security controls.	operating procedures). Organizations identify personnel with specific roles and						
				, ,	responsibilities associated with physical security controls requiring specialized training.						
					responsibilities associated with physical security controls requiring specialized training.						
AT-3 (3)	2	Awareness and Training Role-Based Security		The organization includes practical exercises in security training that reinforce training objectives.	Practical exercises may include for example security training for software developers that			_			
A1-5 (5)		Trainina Practical Exercises		The organization includes practical exercises in security training that reinforce training objectives.	includes simulated cyber attacks exploiting common software vulnerabilities (e.g., buffer						
1		Training Practical Exercises									
1					overflows), or spear/whale phishing attacks targeted at senior leaders/executives. These						
1	I				types of practical exercises help developers better understand the effects of such	1		1			
1					vulnerabilities and appreciate the need for security coding standards and processes.	1		1			
AT-3 (4)	2	Awareness and Training Role-Based Security		The organization provides training to its personnel on [Assignment: organization-defined	A well-trained workforce provides another organizational safeguard that can be employed						
		Training Suspicious Communications and		indicators of malicious code] to recognize suspicious communications and anomalous behavior in	as part of a defense-in-depth strategy to protect organizations against malicious code						
		Anomalous System Behavior		organizational information systems.	coming in to organizations via email or the web applications. Personnel are trained to look						
		,			for indications of potentially suspicious email (e.g., receiving an unexpected email,						
					receiving an email containing strange or poor grammar, or receiving an email from an						
					unfamiliar sender but who appears to be from a known sponsor or contractor). Personnel						
					are also trained on how to respond to such suspicious email or web communications (e.g.,						
					not opening attachments, not clicking on embedded web links, and checking the source of						
					email addresses). For this process to work effectively, all organizational personnel are						
					trained and made aware of what constitutes suspicious communications. Training						
					personnel on how to recognize anomalous behaviors in organizational information systems						
					can potentially provide early warning for the presence of malicious code. Recognition of						
					such anomalous behavior by organizational personnel can supplement automated						
					malicious code detection and protection tools and systems employed by organizations.

					integrated, and used in consultation with legal counsel in accordance with applicable federal						
					laws, Executive Orders, directives, policies, regulations, or standards.						
AU-14 (1)	2	Audit and Accountability Session Audit System Start-Up		The information system initiates session audits at system start-up.							
AU-14 (2)	2	Audit and Accountability Session Audit		The information system provides the capability for authorized users to capture/record and log							
AU-14 (3)	2	Capture/Record and Log Content Audit and Accountability Session Audit Remote		content related to a user session. The information system provides the capability for authorized users to remotely view/hear all							
		Viewing / Listening		content related to an established user session in real time.							
AU-15	1	Audit and Accountability Alternate Audit Capability		The organization provides an alternate audit capability in the event of a failure in primary audit capability that provides [Assignment: organization-defined alternate audit functionality].	Since an alternate audit capability may be a short-term protection employed until the failure in the primary auditing capability is corrected, organizations may determine that the	AU-5	P0				
					alternate audit capability need only provide a subset of the primary audit functionality that						
AU-16	1	Audit and Accountability Cross-Organizational		The organization employs [Assignment: organization-defined methods] for coordinating	is impacted by the failure. When organizations use information systems and/or services of external organizations, the	AU-6	PO				
	•	Auditing		[Assignment: organization-defined audit information] among external organizations when audit	auditing capability necessitates a coordinated approach across organizations. For example,						
				information is transmitted across organizational boundaries.	maintaining the identity of individuals that requested particular services across organizational boundaries may often be very difficult, and doing so may prove to have						
					significant performance ramifications. Therefore, it is often the case that cross-						
					organizational auditing (e.g., the type of auditing capability provided by service-oriented						
					architectures) simply captures the identity of individuals issuing requests at the initial information system, and subsequent systems record that the requests emanated from						
					authorized individuals.						
AU-16 (1)	2	Audit and Accountability Cross-Organizational		The organization requires that the identity of individuals be preserved in cross-organizational	This control enhancement applies when there is a need to be able to trace actions that are						
''		Auditing Identity Preservation		audit trails.	performed across organizational boundaries to a specific individual.						
								\Box			

Control ID AU-16 (2)	Level 2	Control Name Withdra Audit and Accountability Cross-Organizational Auditing Sharing of Audit Information	Ontrol Text The erapination provides cross-organizational audit information to [Assignment: organization-defined organizations] based on [Assignment: organization-defined cross-organizational sharing agreements].	Supplemental Guidance Recause of the distributed nature of the oudit information, cross-organization sharing of audit information may be essential for effective analysis of the auditing being performed. For example, the audit records of one organization may not provide sufficient information to determine the appropriate or inappropriate use of organizational information resources by individuals in other organizations. In some instances, only the home organizations of individuals have the appropriate knowledge to make such determinations, thus requiring the sharing of audit information among organizations.	Related Controls	Priority	Low	Mod	High	Notes
CA	0	Security Assessment and Authorization								
CA-1	1	Security Assessment and Authorization Security Assessment and Authorization Policy and Procedures	The organization: a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a.1. A security assessment and authorization policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and a.2. Procedures to facilitate the implementation of the security assessment and authorization policy and associated security assessment and authorization controls; and b. Reviews and updates the current: b.1. Security assessment and authorization policy (Assignment: organization-defined frequency); and b.2. Security assessment and authorization procedures [Assignment: organization-defined frequency].	This control addresses the establishment of policy and procedures for the effective implementation of selected security controls and control enhancements in the CA family. Policy and procedures reflect applicable federal laws, Executive Orders, directives, regulations, policies, standards, and guidance. Security program policies and procedures at the organization level may make the need for system-specific policies and procedures unnecessary. The policy can be included as part of the general information security policy for organizations or conversely, can be represented by multiple policies reflecting the complex nature of certain organizations. The procedures can be established for the security program in general and for particular information systems, if needed. The organizational risk management strategy is a key factor in establishing policy and procedures.	PM-9	P1	х	х	x	
CA-2	1	Security Assessment and Authorization Security Assessments	The organization: a. Develops a security assessment plan that describes the scope of the assessment including: a.1. Security controls and control enhancements under assessment; a.2. Assessment procedures to be used to determine security control effectiveness; and a.3. Assessment environment, assessment learn, and assessment roles and responsibilities; b. Assesses the security controls in the information system and its environment of operation [Assignment organization-defined frequency] to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting established security requirements; c. Produces a security assessment report that documents the results of the assessment; and d. Provides the results of the security control assessment to [Assignment: organization-defined individuals or roles].	Organizations axes as caurity controls in organizational information systems and the environments in which those yettems operate as part of: (i) initial and organizations (and processes and the environments in which those yettems operate as part of: (i) initial and organizations (iii) (EVA manual assessments; (ii) continuous monitoring; and (iv) system development life cycle activities. Security assessments: (ii) entire whereases and deficiencies early in the development process; (ii) provide essential information necreeds to make risk-based decisions as part of in the development process; (ii) provide essential information neceded to make risk-based decisions as part of security authorization processes; and (iv) ensure compliance to whereasility missions procedures. Assessments are conducted on the implemented security controls from Appendix F (main catalog) and Appendix (iv) Program Plant and Management controls) as documented in Systems Security Plant and Information Security Program Plant and Management controls) as documented in Systems Security Plant and Information Security Program Plant (iv) Plant	CA-S,CA-6,CA-7,PM- 9,RA-5,SA-11,SA- 12,SI-4	P2	X	x	x	
CA-2(1)	2	Security Assessment and Authorization Security Assessments Independent Assessors	The organization employs assessors or assessment teams with [Assignment: organization-defined level of independence] to conduct security control assessments.	Independent assessor or assessment teams are individuals or groups who conduct impartial assessments of organizational information systems. Impartiality implies that assessors are free from any perceived or actual conflicts of interest with regard to the development, operation, or management of the organizational information systems under assessment or to the determination of security control effectiveness. To achieve impartiality, assessors should not: (i) create a mutual or conflicting interest with the organizations where the assessments are being conducted, (ii) assess their own work, (iii) act as management or employees of the organizations they are serving, or (iv) place themselves in positions of advoccory for the organizations caquining their services. Independent assessments can be obtained from elements within organizations they are serving, or (iv) place themselves in positions of advoccory for the organizations or can be contracted to public or private sector entities outside of organizations. Authorizing officials determine the required level of independent of positions are such as the security categories of sindomation systems and/or the ultimate risk to organizational operations, organizational ossess, or individuals. Authorizing officials ols determined the level of assessment services have sufficient assurance that the results are sound and can be used to make credible, risk-based decisions. This includes determining whether contracted security assessment services have sufficient independence, for example, when information system owners are not directly involved in contracting processes or cannot unduly influence the importability of passessors conducting assessments. In special situations, for example, when organizations that own the information assessment processes or cannot unduly influence the importability of passessors conducted by individuals that are in the developmental, operational, or management thain of system owners are conducted by independent in the assessment resures to evaluate				X	X	
CA-2 (2)	2	Security Assessment and Authorization Security Assessments Specialized Assessments	The organization includes as part of security control assessments, [Assignment: organization-defined frequency,], [Selection: announced; unannounced], [Selection (one or more): in-depth monitoring: vulnerability scanning: malicious user testing; insider threat assessment; performance/load testing; [Assignment: organization-defined other forms of security assessment]].	Organizations can employ information system monitoring, insider threat assessments, malicious user testing, and other forms of testing (e.g., verification and validation) to improve readiness by exercising organizational capabilities and indicating current performance levels as a means of facusing actions to improve security. Organizations conduct assessment activities in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards. Authorizing officials approve the assessment methods in coordination with the organizational risk executive function. Organizations an incorporate vulnerabilities uncovered during assessments into vulnerability remediation processes.	PE-3,SI-2				X

CONTROL ID CA-2 (3)	Level 2	Control Name Security Assessment and Authorization Security Assessments External Organizations	MuldiaWh	The organization accepts the results of an assessment of [Assignment: organization-defined information system] performed by [Assignment: organization-defined external organization] when	Organizations may often rely on assessments of specific information systems by other (external) organizations. Utilizing such existing assessments (i.e., reusing existing	related Controls	PHONEY	LOW	WIOG	nign	Notes
				the assessment meets [Assignment: organization-defined requirements].	assessment evidence) can significantly decrease the time and resources required for organizational assessments by limiting the amount of independent assessment activities that organizations need to perform. The factors that organizations may consider in determining whether to accept assessment results from external organizations can vary.						
					Determinations for accepting assessment results can be based on, for example, past assessment experiences one organization has had with another organization, the						
					reputation that organizations have with regard to assessments, the level of detail of supporting assessment documentation provided, or mandates imposed upon organizations						
					by federal legislation, policies, or directives.						
CA-3	1	Security Assessment and Authorization System Interconnections		The organization: a. Authorizes connections from the information system to other information systems through the use of interconnection Security Agreements; b. Documents, for each interconnection, the interface characteristics, security requirements, and the nature of the information communicated; and c. Reviews and updates Interconnection Security Agreements [Assignment: organization-defined	email and website browsing. Organizations carefully consider the risks that may be introduced when information systems are connected to other systems with different security requirements and security controls, both within organizations and external to organizations. Authorizing officials determine the risk associated with information system	AC-3,AC-4,AC-20,AU- 2,AU-12,AU-16,CA- 7,IA-3,SA-9,SC-7,SI-4	PI	×	×	x	
				frequency].	connections and the appropriate controls employed. If interconnecting systems have the same authorizing official, organizations do not need to develop Interconnection Security Agreements. Instead. organizations can describe the interface characteristics between those						
					interconnecting systems in their respective security plans. If interconnecting systems have different authorizing officials within the same organization, organizations can either develop						
					Interconnection Security Agreements or describe the interface characteristics between systems in the security plans for the respective systems. Organizations may also incorporate Interconnection Security Agreement information into formal contracts, especially for						
					interconnections established between federal agencies and nonfederal (i.e., private sector) organizations. Risk considerations also include information systems sharing the same						
					networks. For certain technologies (e.g., space, unmanned aerial vehicles, and medical devices), there may be specialized connections in place during preoperational testing. Such						
					connections may require Interconnection Security Agreements and be subject to additional security controls.						
CA-3 (1)	2	Security Assessment and Authorization System Interconnections Unclassified National Security		The organization prohibits the direct connection of an [Assignment: organization-defined unclassified, national security system] to an external network without the use of [Assignment:	Organizations typically do not have control over external networks (e.g., the Internet). Approved boundary protection devices (e.g., routers, firewalls) mediate communications						
		System Connections		organization-defined boundary protection device].	(i.e., information flows) between unclassified national security systems and external networks. This control enhancement is required for organizations processing, storing, or transmitting Controlled Unclassified Information (CUI).						
CA-3 (2)	2	Security Assessment and Authorization System Interconnections Classified National Security System Connections		The organization prohibits the direct connection of a classified, national security system to an external network without the use of [Assignment: organization-defined boundary protection device].	Organizations typically do not have control over external networks (e.g., the Internet). Approved boundary protection devices (e.g., routers, firewalls) mediate communications (i.e., information flows) between classified national security systems and external						
		System connections		oc neg.	networks. In addition, approved boundary protection devices (typically managed interface/cross-domain systems) provide information flow enforcement from information systems to external networks.						
CA-3 (3)	2	Security Assessment and Authorization System Interconnections Unclassified Non-National		The organization prohibits the direct connection of an [Assignment: organization-defined unclassified, non-national security system] to an external network without the use of [Assignment,	systems to external networks. Organizations typically do not have control over external networks (e.g., the Internet). Approved boundary protection devices (e.g., routers, firewalls) mediate communications						
		Security System Connections		organization-defined boundary protection device].	(i.e., information flows) between unclassified non-national security systems and external networks. This control enhancement is required for organizations processing, storing, or						
CA-3 (4)	2	Security Assessment and Authorization System		The organization prohibits the direct connection of an [Assignment: organization-defined	transmitting Controlled Unclassified Information (CUI). A public network is any network accessible to the general public including, for example, the						
CH-3 (4)		Interconnections Connections to Public Networks		information system] to a public network.	Internet and organizational extranets with public access.						
CA-3 (5)	2	Security Assessment and Authorization System Interconnections Restrictions on External System Connections		The organization employs [Selection: allow-all, deny-by-exception; deny-all, permit-by-exception] policy for allowing [Assignment: organization-defined information systems] to connect to external information systems.	Organizations can constrain information system connectivity to external domains (e.g., websites) by employing one of two policies with regard to such connectivity: (i) allow-all, deny by exception, also known as blacklisting (the weaker of the two policies); or (ii) deny-	CM-7			х	х	
		Comections		and the control of th	all, allow by exception, also known as whitelisting (the stronger of the two policies). For either policy, organizations determine what exceptions, if any, are acceptable.						
CA-4	1	Security Assessment and Authorization Security Certification	Х								[Withdrawn: Incorporated into CA-2]
CA-5	1	Security Assessment and Authorization Plan of Action and Milestones		The organization: a. Develops a plan of action and milestones for the information system to document the organization's planned remedial actions to correct weaknesses or deficiencies noted during the assessment of the security controls and to reduce or eliminate known vulnerabilities in the system;	Plans of action and milestones are key documents in security authorization packages and are subject to federal reporting requirements established by OMB.	CA-2,CA-7,CM-4,PM-4	P3	х	х	х	
				and b. Updates existing plan of action and milestones [Assignment: organization-defined frequency] based on the findings from security controls assessments, security impact analyses, and continuous monitoring activities.							
CA-5 (1)	2	Security Assessment and Authorization Plan of Action and Milestones Automation Support for Accuracy / Currency		The organization employs automated mechanisms to help ensure that the plan of action and milestones for the information system is accurate, up to date, and readily available.

CA-6	1	Security Assessment and Authorization Security	The organization:	Security authorizations are official management decisions, conveyed through authorization	CA-2,CA-7,PM-9,PM-		X	X	X	Notes
		Authorization	a. Assigns a senior-level executive or manager as the authorizing official for the information	decision documents, by senior organizational officials or executives (i.e., authorizing	10					
			system;	officials) to authorize operation of information systems and to explicitly accept the risk to						
			b. Ensures that the authorizing official authorizes the information system for processing before	organizational operations and assets, individuals, other organizations, and the Nation based						
			commencing operations; and	on the implementation of agreed-upon security controls. Authorizing officials provide						
			c. Updates the security authorization [Assignment: organization-defined frequency].	budgetary oversight for organizational information systems or assume responsibility for the mission/business operations supported by those systems. The security authorization proces						
				is an inherently federal responsibility and therefore, authorizing officials must be federal						
				employees. Through the security authorization process, authorizing officials assume						
				responsibility and are accountable for security risks associated with the operation and use o	f					
				organizational information systems. Accordingly, authorizing officials are in positions with						
				levels of authority commensurate with understanding and accepting such information security-related risks. OMB policy requires that organizations conduct ongoing						
				authorizations of information systems by implementing continuous monitoring programs.						
				Continuous monitoring programs can satisfy three-year reauthorization requirements, so						
				separate reauthorization processes are not necessary. Through the employment of						
				comprehensive continuous monitoring processes, critical information contained in						
				authorization packages (i.e., security plans, security assessment reports, and plans of action and milestones) is updated on an ongoing basis, providing authorizing officials and						
				information system owners with an up-to-date status of the security state of organizational						
				information systems and environments of operation. To reduce the administrative cost of						
				security reauthorization, authorizing officials use the results of continuous monitoring						
				processes to the maximum extent possible as the basis for rendering reauthorization						
				decisions.

				security control assessments, the effectiveness of configuration settings, and findings from						
			The second secon	Inspectors General or auditors.	54.42	n2				
CA-8	1	Security Assessment and Authorization Penetration Testing	The organization conducts penetration testing [Assignment: organization-defined frequency] on [Assignment: organization-defined information systems or system components].	Penetration testing is a specialized type of assessment conducted on information systems or individual system components to identify vulnerabilities that could be exploited by	2A-12	P2			l*	
			and the second s	adversaries. Such testing can be used to either validate vulnerabilities or determine the						
				degree of resistance organizational information systems have to adversaries within a set of						
				specified constraints (e.g., time, resources, and/or skills). Penetration testing attempts to						
				duplicate the actions of adversaries in carrying out hostile cyber attacks against						
				organizations and provides a more in-depth analysis of security-related weaknesses/deficiencies. Organizations can also use the results of vulnerability analyses to						
				support penetration testing activities. Penetration testing can be conducted on the						
				hardware, software, or firmware components of an information system and can exercise						
				both physical and technical security controls. A standard method for penetration testing						
				includes, for example: (i) pretest analysis based on full knowledge of the target system; (ii)						
				pretest identification of potential vulnerabilities based on pretest analysis; and (iii) testing designed to determine exploitability of identified vulnerabilities. All parties agree to the						
				rules of engagement before the commencement of penetration testing scenarios.						
				Organizations correlate the penetration testing rules of engagement with the tools,						
				techniques, and procedures that are anticipated to be employed by adversaries carrying out						
				attacks. Organizational risk assessments guide decisions on the level of independence						
				required for personnel conducting penetration testing.						
								_	_	
CA-8 (1)	2	Security Assessment and Authorization	The organization employs an independent penetration agent or penetration team to perform penetration testing on the information system or system components.	Independent penetration agents or teams are individuals or groups who conduct impartial penetration testing of organizational information systems. Impartiality implies that	CA-2					
		Penetration Testing Independent Penetration Agent or Team	peneduaon testing on the injornation system or system components.	penetration testing of organizational information systems. Importiality implies that penetration agents or teams are free from any perceived or actual conflicts of interest with						
				regard to the development, operation, or management of the information systems that are						
				the targets of the penetration testing. Supplemental guidance for CA-2 (1) provides						
				additional information regarding independent assessments that can be applied to						
				penetration testing.			1	1		

1 1 S S S S S S S S S S S S S S S S S S	Control Name Withdre Security Assessment and Authorization Penetration Testing Red Team Exercises Security Assessment and Authorization Internal System Connections	Control Text The arganization employs [Assignment: organization-defined red team exercises] to simulate alternats by adversaries to compromise arganizational information systems in accordance with [Assignment: organization-defined rules of engagement]. The organization:	Supplemental Guidence Red team exercises extend the objectives of penetration testing by examining the security posture of organizations and their ability to implement effective cyber defenses. As such, red team exercises reflect simulated adversarial attempts to compromise organizational mission/business functions and provide a comprehensive assessment of the security state of information systems and organizations. Simulated adversarial attempts to compromise organizational missions/business functions and the information systems that support those missions/functions may include technology-focused attacks (e.g., interactions with hardware, software, or firmware components and/or mission/business processes) and social engineering-based attacks (e.g., interactions via email, telephone, shoulder surfing, or personal conversations). While penetration testing may be largely laboratory-based testing, organizations use red team exercises to provide more comprehensive assessments that reflect real-world conditions. Red team exercises can be used to improve security awareness and training and to assess levels of security control effectiveness.	Related Controls	Priority L	.ow Mo	od F	High	Notes
2 5		The organization:	T and the second se						
2		 a. Authorizes internal connections of [Assignment: organization-defined information system components or classes of components) to the information system; and b. Documents, for each internal connection, the interface characteristics, security requirements, and the nature of the information communicated. 	This control applies to connections between organizational information systems and (separate) constituent system components (i.e., intra-system connections) including, for example, system connections with mobile devices, notebook/desktop computers, printers, copiers, facsimile machines, scanners, sensors, and servers. Instead of authorizing each individual internal connection, organizations can authorize internal connections for a class of components with common characteristics and/or configurations, for example, all digital printers, scanners, and copiers with a specific processing, storage, and transmission capability or all smart phones with a specific baseline configuration. 	Security Assessment and Authorization Internal System Connections Security Compliance Checks	The information system performs security compliance checks on constituent system components prior to the establishment of the internal connection.	Security compliance checks may include, for example, verification of the relevant baseline configuration.	CM-6					
0 0	Configuration Management								
1 0	Configuration Management Configuration Management Policy and Procedures	The organization: a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a.1. A configuration management policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and a.2. Procedures to facilitate the implementation of the configuration management policy and associated configuration management controls; and b. Reviews and updates the current: b.1. Configuration management policy [Assignment: organization-defined frequency]; and b.2. Configuration management procedures [Assignment: organization-defined frequency].	This control addresses the establishment of policy and procedures for the effective implementation of selected sociarity controls and control enhancements in the CM family. Policy and procedures reflect applicable federal laws, Executive Orders, directives, regulations, policies, standards, and guidance. Security program policies and procedures at the organization level may make the need for system-specific policies and procedures unnecessary. The policy can be included as part of the general information security policy for organizations or conversely, can be represented by multiple policies reflecting the complex nature of certain organizations. The procedures can be established for the security program in general and for particular information systems, if needed. The organizational risk management strategy is a key factor in establishing policy and procedures.	PM-9	P1 X	x	,	ĸ	
1 (Configuration Management Baseline Configuration	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	This control establishes baseline configurations for information systems and system components including communications and connectivity-related aspects of systems. Baseline configurations are documented, formally reviewed and agreed-upon sets of specifications for information systems or configuration items within those systems. Baseline configurations serve as a basis for future builds, releases, and/or changes to information systems. Baseline configurations include information about information systems of software packages installed on workstations, notebook computers, servers, network components, or mobile devices; current version numbers and patch information operating systems and applications; and configuration settings/parameters), network topology, and the logical placement of those components within the system architecture. Maintaining baseline configurations requires creating new baselines as organizational information systems change over time. Baseline configurations of information systems reflect the current enterprise architecture.	CM-3, CM-6, CM- 8, CM-9, SA-10, PM- 5, PM-7	P1 X	X	,	к	
	Configuration Management Baseline Configuration Reviews and Updates	The organization reviews and updates the baseline configuration of the information system: (a) [Assignment: organization-defined frequency]; (b) When required due to [Assignment organization-defined circumstances]; and (c) As an integral part of information system component installations and upgrades.		CM-5		x	,	х	
(Configuration Management Baseline Configuration Automation Support for Accuracy / Currency	The arganization employs automated mechanisms to maintain an up-to-date, complete, accurate and readily available baseline configuration of the information system.	Automated mechanisms that help arganizations maintain consistent baseline configurations for information systems include for example, hardware and software inventory tools, configuration management tools, and network management tools. Such tools can be deployed and/or allocated as common controls, at the information system level, or at the operating system or component level (e.g., on workstations, servers, notebook computers, network components, or mobile devices). Tools can be used, for example, to track version numbers on operating system applications, types of software installed, and current patch levels. This control enhancement can be satisfied by the implementation of CM-82 (3) for organizations that choose to combine information system component inventory and baseline configuration activities.	CM-7,RA-5			,	ĸ	
2 (Configuration Management Baseline Configuration Retention of Previous Configurations	The organization retains [Assignment: organization-defined previous versions of baseline configurations of the information system] to support rollback.	Retaining previous versions of baseline configurations to support rollback may include, for example, hardware, software, firmware, configuration files, and configuration records.			х	,	х

Control ID	Level	Control Name	Control Tout	Supplemental Cuidance	Related Controls	Priority	Law	Mod	High	Notes
CM-4 (1)	2	Control Name Withdrawn Configuration Management Security Impact Analysis Separate Test Environments	Control Text The organization analyzes changes to the information system in a separate test environment before implementation in an operational environment, looking for security impacts due to flaws, weaknesses, incompatibility, or intentional mailice.	Supplemental Culidance Separate test environment in this context means an environment that is physically or logically isolated and distinct from the operational environment. The separation is sufficient to ensure that activities in the test environment do not impact activities in the operational environment, and information in the operational environment is not inadvertently transmitted to the test environment. Separate environments can be achieved by physical or logical means. If physically separate test environments are not used, organizations determine the strength of mechanism required when implementing logical separation (e.g., separation achieved through virtual machines).	SA-11,SC-3,SC-7	Priority	Low	Mod	X X	Notes
CM-4 (2)	2	Configuration Management Security Impact Analysis Verification of Security Functions	The organization, ofter the information system is changed, checks the security functions to verify that the functions are implemented correctly, operating as intended, and producing the desired outcome with regard to meeting the security requirements for the system.	Implementation is this context refers to installing changed code in the operational information system.	SA-11					
CM-S	1	Configuration Management Access Restrictions for Change	The organization defines, documents, approves, and enforces physical and logical access restrictions associated with changes to the information system.	Any changes to the hardware, software, and/or firmware components of information systems can potentially have significant effects on the overall security of the systems. Therefore, organizations permit only qualified and authorized individuals to access information systems for purposes of initiating changes, including upgrades and modifications. Organizations maintain records of access to ensure that configuration change control is implemented and to support after-the-fact actions should organizations discover any unauthorized changes. Access restrictions for change also includes oftware libraries. Access restrictions include, for example, physical and logical access controls (see AC-3 and PE-3), workflow automation, media libraries, abstract layers (e.g., changes implemented into third-party interfaces rather than directly into information systems), and change windows (e.g., changes occur only during specified times, making unauthorized changes easy to discover).	AC-3,AC-6,PE-3	P1		x	х	
CM-5 (1)	2	Configuration Management Access Restrictions for Change Automated Access Enforcement / Auditing	The information system enforces access restrictions and supports auditing of the enforcement actions.		AU-2,AU-12,AU- 6,CM-3,CM-6				Х	
CM-5 (2)	2	Configuration Management Access Restrictions for Change Review System Changes	The organization reviews information system changes [Assignment: organization-defined frequency] and [Assignment: organization-defined circumstances] to determine whether unauthorized changes have occurred.		AU-6,AU-7,CM-3,CM- 5,PE-6,PE-8				х	
CM-5 (3)	2	Configuration Management Access Restrictions for Change Signed Components	The information system prevents the installation of [Assignment: organization-defined software and firmware components] without verification that the component has been digitally signed using a certificate that is recognized and approved by the organization.		CM-7,SC-13,SI-7				х	
CM-5 (4)	2	Configuration Management Access Restrictions for Change Dual Authorization	The organization enforces dual authorization for implementing changes to [Assignment: organization-defined information system components and system-level information].	Organizations employ dual authorization to ensure that any changes to selected information system components and information cannot occur unless two qualified individuals implement such changes. The two individuals possess sufficient skills/expertise to determine if the proposed changes are correct implementations of approved changes. Dual authorization may also be known as two-person control.	AC-5,CM-3					
CM-5 (5)	2	Configuration Management Access Restrictions for Change Limit Production / Operational Privileges	The organization: (a) Limits privileges to change information system components and system-related information within a production or operational environment; and (b) Reviews and reevaluates privileges [Assignment: organization-defined frequency].	In many organizations, information systems support multiple core missions/husiness functions. Limiting privileges to change information system components with respect to operational systems is necessary because changes to a particular information system component may have far-reaching effects on mission/business processes supported by the system where the component resides. The complex, many-to-many relationships between systems and mission/business processes are in some cases, unknown to developers.	AC-2					
CM-5 (6)	2	Configuration Management Access Restrictions for Change Limit Library Privileges	The organization limits privileges to change software resident within software libraries.	Software libraries include privileged programs.	AC-2

Control ID	Level	Control Name Withdra	vn Control Text	Supplemental Guidance	Related Controls	Priority	Low	Mod	High	Notes
CM-8 (7)	2	Configuration Management Information System Component Inventory Centralized Repository	The organization provides a centralized repository for the inventory of information system components.	Organizations may choose to implement centralized information system component inventories that include components from all organizational information systems. Centralized repositories of information system component inventories provide						
				Lentralized repositories of information system component inventiories provide opportunities for efficiencies in accounting for organizational hardware, software, and firmware assets. Such repositories may also help organizations rapidly identify the location						
				and responsible individuals of system components that have been compromised, breached, or are otherwise in need of mitigation actions. Organizations ensure that the resulting						
				centralized inventories include system-specific information required for proper component accountability (e.g., information system association, information system owner).						
CM-8 (8)	2	Configuration Management Information System Component Inventory Automated Location	The organization employs automated mechanisms to support tracking of information system components by geographic location.	The use of automated mechanisms to track the location of information system components can increase the accuracy of component inventories. Such capability may also help						
		Tracking		organizations rapidly identify the location and responsible individuals of system components that have been compromised, breached, or are otherwise in need of mitigation actions.						
CM-8 (9)	2	Configuration Management Information System Component Inventory Assignment of Components to Systems	The organization: (a) Assigns (Assignment: organization-defined acquired information system components) to an information system; and (b) Receives an acknowledgement from the information system owner of this assignment.	Organizations determine the criteria for or types of information system components (e.g., microprocessors, motherboards, software, programmable logic controllers, and network devices) that are subject to this control enhancement.	SA-4					
СМ-9	1	Configuration Management Configuration Management Plan	The organization develops, documents, and implements a configuration management plan for the information system that: a. Addresser orles, responsibilities, and configuration management processes and procedures; b. Establishes a process for identifying configuration items throughout the system development lif cycle and for managing the configuration items to the configuration items; c. Defines the configuration items for the information system and places the configuration items under configuration management; and d. Protects the configuration management plan from unauthorized disclosure and modification.	policies while being tailored to individual information systems. Such plans define detailed processes and procedures for how configuration management is used to support system	4,CM-5,CM-8,SA-10	P1		х	х	
				configuration management plan for the organization at large with subsets of the plan implemented on a system basis. Configuration management approval processes include designation of key management stakeholders responsible for reviewing and approving proposed changes to information systems, and personnel that conduct security impact analyses prior to the implementation of changes to the systems. Configuration items are the information system items (hardware, software, firmware, and documentation) to be configuration-managed. As information systems continue through the system development life cycle, new configuration items may be identified and some existing configuration items may no longer need to be under configuration control.						
CM-9 (1)	2	Configuration Management Configuration	The organization assigns responsibility for developing the configuration management process to organizational personnel that are not directly involved in information system development.	In the absence of dedicated configuration management teams assigned within organizations, system developers may be tasked to develop configuration management						
		Management Plan Assignment of Responsibility	organizational personnel that are not alrectly involved in Information system development.	organizations, system aceleapers may be tasked to aceleap conjuguration management processes using personnel who are not directly involved in system development or integration. This separation of duties ensures that organizations establish and maintain sufficient degree of independence between the information system development and integration processes and configuration management processes to facilitate quality control and more effective oversight.						
CM-10	1	Configuration Management Software Usage Restrictions	The organization: a. Uses software and associated documentation in accordance with contract agreements and copyright laws; b. Tracks the use of software and associated documentation protected by quantity licenses to control copyring and distribution; and c. Controls and documents the use of peer-to-peer file sharing technology to ensure that this capability is not used for the unauthorized distribution, display, performance, or reproduction of copyrighted work.	Software license tracking can be accomplished by manual methods (e.g., simple spreadsheets) or automated methods (e.g., specialized tracking applications) depending on organizational needs.	AC-17,CM-8,SC-7	P2	x	х	х	
CM-10 (1)	2	Configuration Management Software Usage Restrictions Open Source Software	The organization establishes the following restrictions on the use of open source software: [Assignment: organization-defined restrictions].	Open source software refers to software that is available in source code form. Certain software rights normally reserved for copyright holders are routinely provided under software license agreements that permit individuals to study, change, and improve the software. From a security perspective, the major advantage of open source software is that provides argonizations with the ability to examine the source code. However, there are also various licensing issues associated with open source software including, for example, the constraints on derivative use of such software.						
CM-11		Configuration Management User-Installed Software	The organization: a. Establishes [Assignment: organization-defined policies] governing the installation of software by users; b. Enforces software installation policies through [Assignment: organization-defined methods]; and c. Monitors policy compliance at [Assignment: organization-defined frequency].	installed, organizations identify permitted and prohibited actions regarding software		P1	х	х	х	
CM-11 (1)		Configuration Management User-Installed Software Alerts for Unauthorized Installations	The information system alerts [Assignment: organization-defined personnel or roles] when the unauthorized installation of software is detected.		CA-7,SI-4					
CM-11 (2)		Configuration Management User-Installed Software Prohibit Installation Without Privileged Status	The information system prohibits user installation of software without explicit privileged status.	Privileged status can be obtained, for example, by serving in the role of system administrator.	AC-6

Control ID	Level	Control Name	Control Tout	Supplemental Cuidance	Related Controls	Duionitus	law	Mod U	liab	Votes
CP-1	1	Control Name Withdrawn Contingency Planning Policy and Procedures Withdrawn	Control Text The organization: a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a.1. A contingency planning policy that addresses purgose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and a.2. Procedures to facilitate the implementation of the contingency planning policy and associated contingency planning controls; and b. Reviews and updates the current: b.1. Contingency planning policy [Assignment: organization-defined frequency]: and b.2. Contingency planning procedures [Assignment: organization-defined frequency].	Supplicational cultilation. This control addresses the establishment of policy and procedures for the effective implementation of selected security controls and control enhancements in the CP family. Policy and procedures reflect applicable federal laws, Executive Orders, directives, regulations, policies, standards, and guidance. Security program policies and procedures are the organization level may make the need for system-specific policies and procedures unnecessary. The policy can be included as part of the general information security policy for organizations or conversely, can be represented by multiple policies reflecting the complex nature of certain organizations. The procedures can be established for the security program in general and for particular information systems, if needed. The organizational risk management strategy is a key factor in establishing policy and procedures.	PM-9	P1	X :	x x	ngu -	acce.
CP-2	1	Contingency Planning Contingency Plan	The organization: a. Develops a contingency plan for the information system that: a. 1. Identifies essential missions and business functions and associated contingency requirements; a. 2. Provides recovery objectives, restoration priorities, and metrics; a. 3. Addresses contingency roles, responsibilities, assigned individuals with contact information; a. 4. Addresses maintaining essential missions and business functions despite an information system disruption, compromise, or failure; a. 5. Addresses eventual, full information system restoration without deterioration of the security safeguards originally planned and implemented; and a. 6. Is reviewed and approved by [Assignment: organization-defined personnel or roles]; b. Distributes copies of the contingency plan to [Assignment: organization-defined key contingency personnel (identified by name and/or by role) and organizational elements); c. Coordinates contingency planning activities with incident handling activities; d. Reviews the contingency plan for the information system [Assignment: organization-defined frequency]; e. Updates the contingency plan to address changes to the organization, information system, or environment of operation and problems encountered during contingency plan implementation, execution, or testing; f. Communicates contingency plan changes to [Assignment: organization-defined key contingency personnel (identified by name and/or by role) and organizational elements]; and g. Protects the contingency plan from unauthorized disclosure and modification.	mission/business processes when systems are compromised. The effectiveness of contingency planning is maximized by considering such planning throughout the phases of the system development life cycle. Performing contingency planning on hardware, software, and firmware development can be an effective means of achieving information system resiliency. Contingency plans reflect the degree of restoration required for organizational information systems since not all systems may need to fully recover to achieve the level of continuity of operations desired. Information system recovery objectives reflect applicable		P1	x	x x		
CP-2 (1)	2	Contingency Planning Contingency Plan Coordinate with Related Plans	The organization coordinates contingency plan development with organizational elements responsible for related plans.	Plans related to contingency plans for organizational information systems include, for example, Business Continuity Plans, Disaster Recovery Plans, Continuity of Operations Plans, Crisis Communications Plans, Critical Infrastructure Plans, Cyber Incident Response Plans, Insider Threat Implementation Plan, and Occupant Emergency Plans.				x x	7	
CP-2 (2)	2	Contingency Planning Contingency Plan Capacity Planning	The organization conducts copacity planning so that necessary capacity for information processing, telecommunications, and environmental support exists during contingency operations.	Capacity planning is needed because different types of threats (e.g., natural disasters, targeted cyber attacks) can result in a reduction of the available processing, telecommunications, and support services originally intended to support the organizational missions/business functions. Organizations may need to anticipate degraded operations during contingency operations and factor such degradation into capacity planning.				Х		
CP-2 (3)	2	Contingency Planning Contingency Plan Resume Essential Missions / Business Functions	The organization plans for the resumption of essential missions and business functions within [Assignment: organization-defined time period] of contingency plan activation.	Organizations may choose to carry out the contingency planning activities in this control enhancement as part of organizational business continuity planning including, for example, as part of business impact analyses. The time period for resumption of essential missions/business functions may be dependent on the severity/extent of disruptions to the information system and its supporting infrastructure.	PE-12			x x		
CP-2 (4)	2	Contingency Planning Contingency Plan Resume All Missions / Business Functions	The organization plans for the resumption of all missions and business functions within [Assignment: organization-defined time period] of contingency plan activation.	Organizations may choose to carry out the contingency planning activities in this control enhancement as part of organizational business continuity planning including, for example, as part of business impact analyses. The time period for resumption of all missions/business functions may be dependent on the severity/extent of disruptions to the information system and its supporting infrastructure.	PE-12			Х		
CP-2 (5)	2	Contingency Planning Contingency Plan Continue Essential Missions / Business Functions	The organization plans for the continuance of essential missions and business functions with little or no loss of operational continuity and sustains that continuity until full information system restoration at primary processing and/or storage sites.	Organizations may choose to carry out the contingency planning activities in this control enhancement as part of organizational business continuity planning including, for example, as part of business impact analyses. Primary pracessing and/or storage sites defined by organizations as part of contingency planning may change depending on the circumstances associated with the contingency (e.g., backup sites may become primary sites).	PE-12			х		
CP-2 (6)	2	Contingency Planning Contingency Plan Alternate Processing / Storage Site	The organization plans for the transfer of essential missions and business functions to alternate processing and/or storage sites with little or no loss of operational continuity and sustains that continuity through information system restoration to primary processing and/or storage sites.	Organizations may choose to carry out the contingency planning activities in this control enhancement as part of organizational business continuity planning including, for example, as part of business impact analyses. Primary pracessing and/or storage sites defined by organizations as part of contingency planning may change depending on the circumstances associated with the contingency (e.g., backup sites may become primary sites).	PE-12					
CP-2 (7)	2	Contingency Planning Contingency Plan Coordinate with External Service Providers	The organization coordinates its contingency plan with the contingency plans of external service providers to ensure that contingency requirements can be satisfied.	When the capability of an organization to successfully carry out its core missions/business functions is dependent on external service providers, developing a timely and comprehensive contingency plan may become more challenging. In this situation, organizations coordinate contingency planning activities with the external entities to ensure that the individual plans reflect the overall contingency needs of the organization.	SA-9					
CP-2 (8)	2	Contingency Planning Contingency Plan Identify Critical Assets	The organization identifies critical information system assets supporting essential missions and business functions.	Organizations may choose to carry out the contingency planning activities in this control enhancement as part of organizational business continuity planning including, for example, as part of business impact analyses. Organizations identify critical information system assets so that additional safeguards and countermeasures can be employed (above and beyond those safeguards and countermeasures can be employed (above and beyond those safeguards and countermeasures routinely implementaged to help ensure that arganizational missions/business functions can continue to be conducted during contingency operations. In addition, the identification of critical information assets facilitates the prioritization of organizational resources. Critical information system assets include technical and operational aspects. Technical aspects include, for example, information setchnology services, information settem components, information technology products, and mechanisms. Operational aspects include, for example, procedures (manually executed operations) and personnel (individuals operating technical safeguards and/or executing manual procedures). Organizational program protection plans can provide assistance in identifying critical assets.	SA-14,SA-15			x x

			Withdrawn		Supplemental Guidance						
CP-10	1	Control Name Information System Recovery and Reconstitution	Withdrawn	Control Text The organization provides for the recovery and reconstitution of the information system to a known state after a disruption, compromise, or failure.	Supplemental citiesnice Recovery is executing information system contingency plan activities to restore organizational missions/business functions. Reconstitution takes place following recovery and includes activities for returning organizational information systems to fully operational states. Recovery and reconstitution operations reflect mission and business priorities, recovery point/time and reconstitution objectives, and established organizational metrics consistent with contingency plan requirements. Reconstitution includes the deactivation of any interim information system capabilities that may have been needed during recovery operations. Reconstitution also includes assessments of fully restored information system capabilities, reestablishment of continuous monitoring activities, potential information system reauthorizations, and activities to prepare the systems against future disruptions, compromises, or failures. Recovery/reconstitution capabilities employed by organizations can include both automated mechanisms and manual procedures.	Related Controls CA-2, CA-6, CA-7, CP- 2, CP-6, CP-7, CP-9, SC- 24	Priority P1	X	Mod X	High X	Notes
CP-10 (1)	2	Contingency Planning Information System Recovery and Reconstitution Contingency Plan Testina	Х								[Withdrawn: Incorporated into CP-4]
CP-10 (2)	2	Contingency Planning Information System Recovery and Reconstitution Transaction Recovery		The information system implements transaction recovery for systems that are transaction-based.	Transaction-based information systems include, for example, database management systems and transaction processing systems. Mechanisms supporting transaction recovery include, for example, transaction rollback and transaction journaling.				х .	Х	
CP-10 (3)	2	Contingency Planning Information System Recovery and Reconstitution Compensating Security Controls	Х								[Withdrawn: Addressed through tailoring procedures]
CP-10 (4)	2	Contingency Planning Information System Recovery and Reconstitution Restore Within Time Period		The organization provides the capability to restore information system components within [Assignment: organization-defined restoration time-periods] from configuration-controlled and integrity-protected information representing a known, operational state for the components.	Restoration of information system components includes, for example, reimaging which restores components to known, operational states.	CM-2				Х	
CP-10 (5)	2	Contingency Planning Information System Recovery and Reconstitution Failover Capability	X								[Withdrawn: Incorporated into SI-13]
CP-10 (6)	2	Contingency Planning Information System Recovery and Reconstitution Component Protection		The organization protects backup and restoration hardware, firmware, and software.	Protection of backup and restoration hardware, firmware, and software components includes both physical and technical safeguards. Backup and restoration software includes, for example, router tables, compilers, and other security-relevant system software.	AC-3,AC-6,PE-3					
CP-11	1	Contingency Planning Alternate Communications Protocols		The information system provides the capability to employ [Assignment: organization-defined alternative communications protocols] in support of maintaining continuity of operations.	Contingency plans and the associated training and testing for those plans, incorporate an alternate communications protocol capability as part of increasing the resilience of organizational information systems. Alternate communications protocols include, for example, switching from Transmission Control Protocol/Internet Protocol (TCP/IP) Version 4 to TCP/IP Version 6. Switching communications protocols may affect software applications and therefore, the potential side effects of introducing alternate communications protocols are analyzed prior to implementation.		PO				
CP-12	1	Contingency Planning Safe Mode		The information system, when [Assignment: organization-defined conditions] are detected, enters a safe mode of operation with [Assignment: organization-defined restrictions of safe mode of operation].	For information systems supporting critical missions/business functions including, for example, military operations and weapons systems, civilian space operations, nuclear power plant operations, and air traffic control operations (especially real-time operations) environments), organizations may choose to identify certain conditions under which those systems rever to a predefined safe mode of operation. The safe mode of operation, which can be activated automatically or manually, restricts the types of activities or operations information systems could execute when those conditions are encountered. Restriction includes, for example, allowing only certain functions that could be carried out under limited power or with reduced communications bandwidth.		PO				
CP-13	1	Contingency Planning Alternative Security Mechanisms		The organization employs [Assignment: organization-defined alternative or supplemental security mechanisms] for satisfying [Assignment: organization-defined security functions] when the primary means of implementing the security function is unavailable or compromised.		CP-2	PO				
DI		Data Quality and Integrity									[Privacy Controls]
DI-1		Data Quality and Integrity Data Quality		The organization:	Organizations take reasonable steps to confirm the accuracy and relevance of PII. Such step may include, for example, editing and validating addresses as they are collected or nettered into information systems using automated address verification look-up application programming interfaces (API). The types of measures taken to protect data quality are based on the nature and context of the PII, how it is to be used, and how it was obtained. Measures taken to validate the accuracy of PII that is used to make determinations about the rights, benefits, or privileges of individuals under federal programs may be more comprehensive than those used to validate less sensitive PII. Additional steps may be necessary to validate PII that is obtained from sources other than individuals or the authorized representatives of individuals. When PII is of a sufficiently sensitive nature (e.g., when it is used for annual reconfirmation of a taxpayer's income for a recurring benefit), organizations incorporate mechanisms into information systems and develop corresponding procedures for how frequently, and by what method, the information is to be updated.	AP-2, DI-2, DM-1, IP- 3, SI-10					[Privacy Controls]
DI-1 (1)	2	Data Quality and Integrity Data Quality Validate PII		The organization requests that the individual or individual's authorized representative validate PII during the collection process.							[Privacy Controls]
DI-1 (2)	2	Data Quality and Integrity Data Quality Re- Validate PII		The organization requests that the individual or individual's authorized representative revalidate that PII collected is still accurate [Assignment: organization-defined frequency].							[Privacy Controls]

IA-2	1	Identification and Authentication Identification		The information system uniquely identifies and authenticates organizational users (or processes	Organizational users include employees or individuals that organizations deem to have equivalent status of	AC-2,AC-3,AC-14,AC-	P1	х	Х	х	
		and Authentication (Organizational Users)		acting on behalf of organizational users).	employees (e.g., contractors, guest researchers). This control applies to all accesses other than: (i) accesses that are explicitly identified and documented in AC-14; and (ii) accesses that occur through authorized use of group	17,AC-18,IA-4,IA-5,IA-					
					authenticators without individual authentication. Organizations may require unique identification of individuals in	8					
					group accounts (e.g., shared privilege accounts) or for detailed accountability of individual activity. Organizations						
					employ passwords, tokens, or biometrics to authenticate user identities, or in the case multifactor authentication, or some combination thereof. Access to organizational information systems is defined as either local access or						
					network access. Local access is any access to organizational information systems by users (or processes acting on						
					behalf of users) where such access is obtained by direct connections without the use of networks. Network access						
					is access to organizational information systems by users (or processes acting on behalf of users) where such access is obtained through network connections (i.e., nonlocal accesses). Remote access is a type of network access that						
					involves communication through external networks (e.g., the Internal networks include local area						
					networks and wide area networks. In addition, the use of encrypted virtual private networks (VPNs) for network						
					connections between organization-controlled endpoints and non-organization controlled endpoints may be treated as internal networks from the perspective of protecting the confidentiality and integrity of information traversing	1					
					the network. Organizations can satisfy the identification and authentication requirements in this control by						
					complying with the requirements in Homeland Security Presidential Directive 12 consistent with the specific						
					organizational implementation plans. Multifactor authentication requires the use of two or more different factors						
					to achieve authentication. The factors are defined as: (i) something you know (e.g., password, personal identification number [PIN]); (ii) something you have (e.g., cryptographic identification device, token); or (iii)						
					something you are (e.g., biometric). Multifactor solutions that require devices separate from information systems						
					gaining access include, for example, hardware tokens providing time-based or challenge-response authenticators						
					and smart cards such as the U.S. Government Personal Identity Verification card and the DoD common access card. In addition to identifying and authenticating users at the information system level (i.e., at logon), organizations also						
					employ identification and authentication mechanisms at the application level, when necessary, to provide						
					increased information security. Identification and authentication requirements for other than organizational users						
					are described in IA-8.

Disabiling the identifier after [Assignment: organization-defined time person in the individual properties of the person in the identifier after [Assignment: organization-defined time person in the identifier after [Assignment: organization after [Assignment: organization after [Assignment: organization after [Assignment: organization after [Assignment: organ	identifiers is not applicable to shared information system accounts (e.g., guest and te; anonymous accounts). Typically, individual identifiers are the user names of the information e; system accounts assigned to those individuals. In such instances, the account management ime period]; and activities of AC-2 use account names provided by IA-4. This control also addresses individual
IA-4 (1)	2	Identification and Authentication Identifier Management Prohibit Account Identifiers As Public Identifiers	The organization prohibits the use of information system account identifi- public identifiers for individual electronic mail accounts.	fiers that are the same as Prohibiting the use of information systems occount identifiers that are the same as some public identifier such as the individual identifier section of an electronic mail address, makes it more difficult for adversaries to guess user identifiers on organizational information systems.
IA-4 (2)	2	Identification and Authentication Identifier Management Supervisor Authorization	The organization requires that the registration process to receive an indivisuory authorization.	
IA-4 (3)	2	Management Supervisor Authorization Identification and Authentication Identifier Management Multiple Forms of Certification	supervisor authorization. The organization requires multiple forms of certification of individual idea to the registration authority.	Intification be presented Requiring multiple forms of identification, such as documentary evidence or a combination of documents and biometrics, reduces the likelihood of individuals using fraudulent identification to establish an identity, or at least increases the work factor of potential adversaries.
IA-4 (4)	2	Identification and Authentication Identifier Management Identify User Status	The organization manages individual identifiers by uniquely identifying et [Assignment: organization-defined characteristic identifying individual st	each individual as Characteristics identifying the status of individuals include, for example, contractors and AT-2
IA-4 (5)	2	identification and Authentication Identifier Management Dynamic Management	The information system dynamically manages identifiers.	In contrast to conventional approaches to identification which presume static accounts for preregistered users, many distributed information systems including, for example, service-oriented architectures, rely on establishing identifiers or un mine for entities that were previously unknown. In these situations, organizations anticipate and provision for the dynamic establishment of learnifiers. Prescribished trust relationships and mechanisms with appropriate authorities to volidate identifiers. Prescribished trust relationships and mechanisms with appropriate authorities to volidate identifiers and related credentials are essential.
IA-4 (6)	2	Identification and Authentication Identifier Management Cross-Organization Management	The organization coordinates with [Assignment: organization-defined ext cross-organization management of identifiers.	ternal organizations] for Cross-organization identifier management provides the capability for organizations to appropriately identify individuals, groups, roles, or devices when conducting cross-organization activities involving the processing, storage, or transmission of information.
IA-4 (7)	2	Identification and Authentication Identifier Management In-Person Registration	The organization requires that the registration process to receive an india conducted in person before a designated registration authority.	In person registration reduces the likelihood of froudulent identifiers being issued because it requires the physical presence of individuals and actual face-to-face interactions with designated registration authorities.

IA-9	1	Identification and Authentication Service Identification and Authentication	The organization identifies and authenticates [Assignment: organization-defined information system services] using [Assignment: organization-defined security safeguards].	This control supports service-oriented architectures and other distributed architectural approaches requiring the identification and authentication of information systems services. In such architectures, external services often appear dynamically. Therefore, information systems should be able to determine in a dynamic manner, if external providers and associated services are authentic. Safeguards implemented by organizational information systems to validate provider and service authenticity include, for example, information or code signing, provenance graphs, and/or electronic signatures indicating or including the sources of services.		PO				
IA-9 (1)	2	Identification and Authentication Service Identification and Authentication Information	The organization ensures that service providers receive, validate, and transmit identification and authentication information.							
IA-9 (2)	2	Exchange (identification and Authentication Service (identification and Authentication Transmission of Decisions	The organization ensures that identification and authentication decisions are transmitted between [Assignment: organization-defined services] consistent with organizational policies.	For distributed architectures (e.g., service-oriented architectures), the decisions regarding the validation of identification and authentication claims may be made by services separate from the services acting on those decisions, in such situations, it is necessary to provide the identification and authentication decisions (as apposed to the actual identifiers and authenticators) to the services that need to act on those decisions.	SC-8					
IA-10		Identification and Authentication Adaptive Identification and Authentication	The organization requires that individuals accessing the information system employ [Assignment: organization-defined supplemental authentication techniques or mechanisms] under specific [Assignment: organization-defined circumstances or situations].	Adversaries may compromise individual authentication mechanisms and subsequently attempt to impersonate legitimate users. This situation can potentially occur with any authentication mechanisms employed by organizations. To address this threat, organizations may employ specific techniques/mechanisms and establish protocols to assess suspicious behavior (e.g., individuals accessing information that they do not typically access as part of their normal dutles, roles, or responsibilities, accessing greater quantities of information than the individuals would routinely access, or attempting to access information from suspicious network addresses). In these situations when certain preestablished conditions or triggiers occur, organizations can require selected individuals to provide additional authentication information. Another potential use for adaptive identification and authentication is to increase the strength of mechanism based on the number and/or types of records being accessed.	AU-6,SI-4	PO				
IA-11	1	Identification and Authentication Re- Authentication	The organization requires users and devices to re-authenticate when [Assignment: organization-defined circumstances or situations requiring re-authentication].	In addition to the re-authentication requirements associated with session locks, organizations may require re-authentication of individuals and/or devices in other situations including, for example: (i) when authenticators change; (ii), when roles change; (iii) when security categories of information systems change; (iv), when the execution of privileged functions occurs; (v) after a fixed period of time; or (vi) periodically.	AC-11	PO				
IP-1		Individual Participation and Redress Consent	The organization: a. Provides means, where feasible and appropriate, for individuals to authorize the collection, use, maintaining, and sharing of personally identifiable information (PII) prior to its collection; b. Provides appropriate means for individuals to understand the consequences of decisions to approve or decline the authorization of the collection, use, dissemination, and retention of PII; c. Obtains consent, where feasible and appropriate, from individuals proir to any new uses or disclosure of previously collected PII; and d. Ensures that individuals are aware of and, where feasible, consent to all uses of PII not initially described in the public notice that was in effect at the time the organization collected the PII.		AC-2, AP-1, TR-1, TR-2					vacy Controls]
IP-1 (1)	2	Individual Participation and Redress Consent Mechanisms Supporting Itemized or Tiered Consent	Organizations can provide, for example, individuals' itemized choices as to whether they wish to be contacted for any of a variety of purposes. In this situation, organizations construct consent mechanisms to ensure that organizational operations comply with individual choices.						[Pri	vacy Controls]
IP-2	1	Individual Participation and Redress Individual Access	The organization: a. Provides individuals the ability to have access to their personally identifiable information (PII) maintained in its system(s) of records; b. Publishes rules and regulations governing how individuals may request access to records maintained in a Privacy Act system of records; c. Publishes access procedures in System of Records Notices (SORNs); and d. Adheres to Privacy Act requirements and OMB policies and guidance for the proper processing of Privacy Act requests.	systems of records. Access includes timely, simplified, and inexpensive access to data. Organizational processes for allowing access to records may differ based on resources, legal requirements, or other factors. The organization Senior Agency Official for Privacy (SAOP)/Chief Privacy Officer (CPO) is responsible for the content of Privacy Act regulations and record request processing, in consultation with legal coursels. IR-4 (2)	2	Incident Response Incident Handling Dynamic	The organization includes dynamic reconfiguration of [Assignment: organization-defined	Dynamic reconfiguration includes, for example, changes to router rules, access control lists,		Inionity	NOW I	note:	mgn	noics
		Reconfiguration	information system components] as part of the incident response capability.		2,CM-3,CM-4					
IR-4 (3)	2	Incident Response Incident Handling Continuity of Operations	The organization identifies (Assignment: organization-defined classes of incidents) and [Assignment: organization-defined actions to take in response to classes of incidents] to ensure continuation of organizational missions and business functions.	Classes of incidents include, for example, malfunctions due to design/implementation errors and omissions, targeted malicious attacks, and untargreted malicious attacks. Appropriate includent response actions include, for example, graceful degradation, information system shutdown, fall back to manual mode/alternative technology whereby the system operates differently, employing dacceptive measures, othernate information flows, or operating in a model that is reserved solely for when systems are under attack.						
IR-4 (4)	2	Incident Response Incident Handling Information Correlation	The organization correlates incident information and individual incident responses to achieve an organization-wide perspective on incident awareness and response.	Sometimes the nature of a threat event, for example, a hostile cyber attack, is such that it can only be observed by bringing together information from different sources including various reports and reporting procedures established by organizations.				;	Х	
IR-4 (5)	2	Incident Response Incident Handling Automatic Disabling of Information System	The organization implements a configurable capability to automatically disable the information system if [Assignment: organization-defined security violations] are detected.							
IR-4 (6)	2	Incident Response Incident Handling Insider Threats - Specific Capabilities	The organization implements incident handling capability for insider threats.	While many organizations address insider threat incidents as an inherent part of their organizational incident response capability, this control enhancement provides additional emphasis on this type of threat and the need for specific incident handling capabilities (as defined within organizations) to provide appropriate and timely responses.						
IR-4 (7)	2	incident Response Incident Handling Insider Threats - Intra-Organization Coordination	The organization coordinates incident handling capability for insider threats across [Assignment: arganization-defined components or elements of the organization].	Incident handling for insider threat incidents (including preparation, detection and analysis, containment, eradication, and recovery) requires close coordination among a variety of arganizational components or elements to be effective. These components or elements include, for example, mission/business owners, information system owners, human resources offices, procurement offices, personnel/physical security offices, operations personnel, and risk executive (function). In addition, organizations may require external support from federal, state, and local law enforcement agencies.						
IR-4 (8)	2	incident Response Incident Handling Correlation with External Organizations	The organization coordinates with [Assignment: organization-defined external organizations] to correlate and share [Assignment: organization-defined incident information] to achieve a cross- organization perspective on incident awareness and more effective incident responses.	The coordination of incident information with external organizations including, for example, mission/business partners, military/coalition partners, customers, and multitiered developers, can provide significant benefits. Cross-organizational coordination with respect to incident handling can serve as an important risk management capability. This capability allows organizations to leverage critical information from a variety of sources to effectively respond to information security-related incidents potentially affecting the organization's operations, assets, and individuals.						
IR-4 (9)	2	Incident Response Incident Handling Dynamic Response Capability	The organization employs [Assignment: organization-defined dynamic response capabilities] to effectively respond to security incidents.	This control enhancement addresses the deployment of replacement or new capabilities in a timely manner in response to security incidents (e.g., adversary actions during hastile cyber attacks). This includes capabilities implemented at the mission/business process level (e.g., activating alternative mission/business processes) and at the information system level.	CP-10					
IR-4 (10)	2	Incident Response Incident Handling Supply Chain Coordination	The organization coordinates incident handling activities involving supply chain events with other organizations involved in the supply chain.	Organizations involved in supply chain activities include, for example, system/product developers, integrators, monufacturers, pockagers, assemblers, distributors, vendors, and resellers. Supply chain incidents include, for example, compromise/pracaches involving information system components, information technology products, development processes or personnel, and distribution processes or warehousing facilities.						
IR-5	1	Incident Response Incident Monitoring	The organization tracks and documents information system security incidents.		AU-6,IR-8,PE-6,SC- 5,SC-7,SI-3,SI-4,SI-7	P1	x x		х	
IR-5 (1)	2	Incident Response Incident Monitoring Automated Tracking / Data Collection / Analysis	The arganization employs automated mechanisms to assist in the tracking of security incidents and in the collection and analysis of incident information.	Automated mechanisms for tracking security incidents and collecting/analyzing incident information include, for example, the Einstein network monitoring device and monitoring online Computer Incident Response Centers (CIRCs) or other electronic databases of incidents.	AU-7,IR-4			į	х	
IR-6	1	Incident Response Incident Reporting	The organization: a. Requires personnel to report suspected security incidents to the organizational incident response capability within [Assignment: organization-defined time period]; and b. Reports security incident information to [Assignment: organization-defined authorities].	The intent of this control is to address both specific incident reporting requirements within	IR-4,JR-5,JR-8	P1	x x		х	
IR-6 (1)	2	Incident Response Incident Reporting Automated Reporting	The organization employs automated mechanisms to assist in the reporting of security incidents.		IR-7		x		х	
IR-6 (2)	2	Incident Response Incident Reporting Vulnerabilities Related to Incidents	The organization reports information system vulnerabilities associated with reported security incidents to [Assignment: organization-defined personnel or roles].							
IR-6 (3)	2	Incident Response Incident Reporting Coordination with Supply Chain	The organization provides security incident information to other organizations involved in the supply chain for information systems or information system components related to the incident.	Organizations involved in supply chain activities include, for example, system/product developers, integrators, manufacturers, packagers, assemblers, distributors, vendors, and resellers. Supply chain incidents include, for example, compromises/proenches involving information system components, information technology products, development processes or personnel, and distribution processes or warehousing facilities. Organizations determine the appropriate information to share considering the value gained from support by external organizations with the potential for harm due to sensitive information being released to outside organizations of perhaps questionable trustworthiness.						
IR-7	1	Incident Response Incident Response Assistance	The organization provides an incident response support resource, integral to the organizational incident response capability that offers advice and assistance to users of the information system for the handling and reporting of security incidents.		AT-2,IR-4,IR-6,IR- 8,SA-9	P2	х	: ;	х

					contaminated system. The methods used to communicate information about the spill after						
					the fact do not involve methods directly associated with the actual spill to minimize the risk						
					of further spreading the contamination before such contamination is isolated and eradicated.						
					er adicated.						
IR-9 (1)	2	Incident Response Information Spillage Response I Responsible Personnel		The organization assigns [Assignment: organization-defined personnel or roles] with responsibility for responding to information spills.							
IR-9 (2)	2	Incident Response Information Spillage Response		The organization provides information spillage response training [Assignment: organization-							
IN-3 (2)	_	Training		defined frequency].							
IR-9 (3)	2	Incident Response Information Spillage Response		The organization implements [Assignment: organization-defined procedures] to ensure that	Correction actions for information systems contaminated due to information spillages may						
		Post-Spill Operations		organizational personnel impacted by information spills can continue to carry out assigned tasks	be very time-consuming. During those periods, personnel may not have access to the						
				while contaminated systems are undergoing corrective actions.	contaminated systems, which may potentially affect their ability to conduct organizational business.						
IR-9 (4)	2	Incident Response Information Spillage Response		The organization employs [Assignment: organization-defined security safeguards] for personnel	Security safeguards include, for example, making personnel exposed to spilled information						
		Exposure to Unauthorized Personnel		exposed to information not within assigned access authorizations.	aware of the federal laws, directives, policies, and/or regulations regarding the information						
					and the restrictions imposed based on exposure to such information.						
IR-10	1	Incident Response Integrated Information		The organization establishes an integrated team of forensic/malicious code analysts, tool	Having an integrated team for incident response facilitates information sharing. Such		PO				
I _{IV-10}	1	Security Analysis Team		the organization establishes an integrated team of forensic/malicious code analysts, tool developers, and real-time operations personnel.	capability allows organizational personnel, including developers, implementers, and		1,0				
				and a second control operations personner.	operators, to leverage the team knowledge of the threat in order to implement defensive						
					measures that will enable organizations to deter intrusions more effectively. Moreover, it						
					promotes the rapid detection of intrusions, development of appropriate mitigations, and the						
					deployment of effective defensive measures. For example, when an intrusion is detected,						
					the integrated security analysis team can rapidly develop an appropriate response for operators to implement, correlate the new incident with information on past intrusions, and						
					augment ongoing intelligence development. This enables the team to identify adversary						
					TTPs that are linked to the operations tempo or to specific missions/business functions, and						
					to define responsive actions in a way that does not disrupt the mission/business operations.						
					Ideally, information security analysis teams are distributed within organizations to make the						
					capability more resilient.

MP-1	revel	Media Protection Media Protection Policy and	Withdrawn	Control Text The organization:	This control addresses the establishment of policy and procedures for the effective	Related Controls	Priority P1	Low	X X	X	Notes
WIF-I	1	Media Protection Media Protection Policy and Procedures		The organization: a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a.1. A media protection policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and a.2. Procedures to facilitate the implementation of the media protection policy and associated media protection controls; and b. Reviews and updates the current: b.1. Media protection policy [Assignment: organization-defined frequency]: and b. 2. Media protection procedures [Assignment: organization-defined frequency].	This control addresses the establishment of policy and procedures for the effective implementation of selected security controls and control enhancements in the MP family. Policy and procedures reflect applicable federal laws, Executive Orders, directives, regulations, policies, standards, and guidance. Security program policies and procedures at the organization level may make the need for system-specific policies and procedures unnecessary. The policy can be included as part of the general information security policy for organizations or conversely, can be represented by multiple policies reflecting the complex nature of certain organizations. The procedures can be established for the security program in general and for particular information systems, if needed. The organizational risk management strategy is a key factor in establishing policy and procedures.	rm ⁻⁹	r.	^	^	^	
MP-2	1	Media Protection Media Access		The organization restricts access to [Assignment: organization-defined types of digital and/or non-digital media] to [Assignment: organization-defined personnel or roles].	Information system media includes both digital and non-digital media. Digital media includes, for example, diskettes, magnetic tapes, external/removable hard disk drives, flash drives, compact disks, and digital video disks. Non-digital media includes, for example, paper and microfilm. Restricting non-digital media access includes, for example, denying access to patient medical records in a community hospital unless the individuals seeking access to such records are authorized healthcare providers. Restricting access to digital media includes, for example, limiting access to design specifications stored on compact disks in the media library to the project leader and the individuals on the development team.		P1	х	х	х	
MP-2 (1)	2	Media Protection Media Access Automated Restricted Access	Х								[Withdrawn: Incorporated into MP-4 (2)]
MP-2 (2)	2	Media Protection Media Access Cryptographic Protection	X								[Withdrawn: Incorporated into SC-28 (1)]
МР-3	1	Media Protection Media Marking		The organization: a. Marks information system media indicating the distribution limitations, handling caveats, and applicable security markings (if any) of the information; and b. Exempts [Assignment: organization-defined types of information system media] from marking as long as the media remain within [Assignment: organization-defined controlled areas].	The term security marking refers to the application/use of human-readable security attributes. The term security labeling refers to the application/use of security attributes with regard to internal data structures within information systems (see AC-16). Information system media includes both digital and non-digital media. Digital media includes, for example, diskette, magnetic tages, external/remosable hard disk frives, flash drives, compact disks, and digital video disks. Non-digital media includes, for example, paper and microfilim. Security marking its generally not required for media containing information determined by organizations to be in the public domain or to be publicly releasable. However, some organizations may require markings for public information indicating that the information is publicly releasable. Marking of information system media reflects applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance.	AC-16,PL-2,RA-3	P2		х	x	
MP-4	1	Media Protection Media Storage		The organization: a. Physically controls and securely stores [Assignment: organization-defined types of digital and/or non-digital media] within [Assignment: organization-defined controlled areas]; and b. Protects information system media until the media are destroyed or sanitized using approved equipment, techniques, and procedures.	Information system media includes both digital and non-digital media. Digital media includes, for example, disketter, amagnetic tapes, external/removable hard disk drives, flash drives, compact disks, and digital video disks. Non-digital media includes, for example, paper and microfilm. Physically controlling information system media includes, for example, conducting inventories, ensuring procedures are in place to allow individuals to check out and return media to the media library, and maintaining accountability for all stored media. Secure storage includes, for example, a locked drawer, desk, or cabinet, or a controlled media library. The type of media storage is commensurate with the security category and/or classification of the information residing on the media. Controlled areas are areas for which organizations provide sufficient physical and procedural safeguards to meet the requirements established for protecting information and/or information systems. For media containing information determined by organizations to be in the public domain, to be publicly releasable, or to have limited or no adverse impact on organizations or individuals if accessed by other than authorized personnel, fewer safeguards may be needed. In these situations, physical access controls provide adequate protection.		r.		^	*	
MP-4 (1)	2	Media Protection Media Storage Cryptographic	X								[Withdrawn: Incorporated into SC-28 (1)]
MP-4 (2)	2	Protection Media Protection Media Storage Automated		The organization employs automated mechanisms to restrict access to media storage areas and	Automated mechanisms can include, for example, keypads on the external entries to media	AU-2,AU-9,AU-6,AU-					
MP-S	1	Restricted Access Media Protection Media Transport		to audit access attempts and access granted. The organization: a, Protects and controls [Assignment: organization-defined types of information system media] during transport outside of controlled areas using [Assignment: organization-defined security safeguards]; b. Maintains accountability for information system media during transport outside of controlled areas; c. Documents activities associated with the transport of information system media; and d. Restricts the activities associated with the transport of information system media to authorized personnel.	storage areas. Information system media includes both digital and non-digital media. Digital media includes, for example, diskettes, magnetic tapes, external/removable hard disk drives, flash divies, compact disks, and digital video disks. Non-digital media includes, for example, paper and microfilm. This control also applies to mobile devices with information storage capability (e.g., smart phones, tablets, E-readers), that are transported outside of controlled areas, controlled areas are areas or spaces for which organizations provide sufficient physical and/or procedural safeguards to meet the requirements established for protecting information and/or information systems. Physical and technical safeguards for media are commensurate with the security category or classification of the information residing on the media. Safeguards to protect media during transport include, for example, locked contains and cryptography. Cryptographic mechanisms can provide confidentiality and integrity protections depending upon the mechanisms used. Activities associated with transport include the actual transport as well as those activities such as releasing media for transport and ensuring that media enters the appropriate transport processes. For the actual transport, authorized transport and courier personnel may include individuals from outside the organization (e.g., U.S. Postal Service or a commercial transport or delivery service). Maintaining accumbality of media during transport includes, for example, restricting transport activities to authorized personnel, and tracking and/or obtaining explicit records of transport activities as the media moves through the transportation system to prevent and detect loss, destruction, or tampering. Organizations establish documentation requirements for activities as sociated with the transportation system to prevent and detect loss, destruction, or tampering. Organizations establish documentation requirements methods for the different types of media transport as part of an overall s	28			х	x	
MP-5 (1)	2	Media Protection Media Transport Protection Outside of Controlled Areas	X								[Withdrawn: Incorporated into MP-5]
MP-5 (2)	2	Media Protection Media Transport Documentation of Activities	X								[Withdrawn: Incorporated into MP-5]
MP-5 (3)	2	Media Protection Media Transport Custodians		The organization employs an identified custodian during transport of information system media outside of controlled areas.	Identified custodians provide organizations with specific points of contact during the media transport process and facilitate individual accountability. Custodial responsibilities can be transferred from one individual to another as long as an unambiguous custodian is identified at all times.						

Control ID	Level	Control Name	Withdrawn	Control Text	Supplemental Guidance	Related Controls	Priority Lo	w N	Mod	High	Notes
MP-5 (4)	2	Media Protection Media Transport Cryptographic Protection		The information system implements cryptographic mechanisms to protect the confidentiality and integrity of information stored on digital media during transport outside of controlled areas.	This control enhancement opplies to both portable storage devices (e.g., USB memory sticks, compact disks, digital video disks, external/removable hard disk drives) and mobile devices with storage copability (e.g., smart phones, tablets, E-readers).	MP-2		X	(х	Total S
MP-6	1	Media Protection Media Sanitization		The organization: a. Sanitizes [Assignment: organization-defined information system media] prior to disposal, release out of organizational control, or release for reuse using [Assignment: organization-defined sanitization techniques and procedures] in accordance with applicable federal and organizational standards and policies, and b. Employs sanitization mechanisms with the strength and integrity commensurate with the security category or classification of the information.	This control applies to all information system media, both digital and non-digital, subject to disposal or reuse, whether or not the media is considered removable. Examples include media found in scanners, copiers, printers, notebook computers, workstations, network components, and mobile devices. The sanitization process removes information from the media such that the information cannot be retrieved or reconstructed. Sanitization techniques, including clearing, purging, cryptographic erase, and destruction, prevent the disclosure of information to unauthorized individuols when such media is reused or released for disposal. Organizations determine the appropriate sanitization methods recognizing that destruction is sometimes necessary when other methods cannot be applied to media requiring sanitization. Organizations use discretion on the employment of approved sanitization techniques and procedures for media containing information deemed to be in the public domain or publicly releasable, or deemed to have no adverse impact on organizations or individuals if released for reuse or disposal. Sanitization of non-digital media includes, for example, removing a classified appendix from an otherwise unclassified document, or redacting selected sections or words from a document by obscuring the redacted sections/words in a manner equivalent in effectiveness to removing them from the document. NSA standards and policies control the sanitization process for media containing classified information.	4	P1 X	x	(x	
MP-6 (1)	2	Media Protection Media Sanitization Review / Approve / Track / Document / Verify		The organization reviews, approves, tracks, documents, and verifies media sanitization and disposal actions.	Organizations review and approve media to be sanitized to ensure compliance with records- retention policies. Tracking/documenting actions include, for example, listing personnel who reviewed and approved sanitization and disposal actions, types of media sanitized, specific files stored on the media, sanitization methods used, date and time of the sanitization actions, personnel who performed the sanitization, verification actions taken, personnel who performed the verification, and disposal action taken. Organizations verify that the sanitization of the media was effective prior to disposal.	SI-12				х	
MP-6 (2)	2	Media Protection Media Sanitization Equipment Testing		The organization tests sanitization equipment and procedures [Assignment: organization-defined frequency] to verify that the intended sanitization is being achieved.	Testing of sanitization equipment and procedures may be conducted by qualified and authorized external entities (e.g., other federal agencies or external service providers).					х	
MP-6 (3)	2	Media Protection Media Sanitization Nondestructive Techniques		The organization applies nondestructive sanitization techniques to portable storage devices prior to connecting such devices to the information system under the following circumstances: [Assignment: organization-defined circumstances requiring sanitization of portable storage devices].	This control enhancement applies to digital media containing classified information and Controlled Unclassified information (CUI). Partable storage devices can be the source of malicious code insertions into arganizational information systems. Many of these devices are obtained from unknown and potentially untrustworthy sources and may contain malicious code that can be readily transferred to information systems through USB ports or other entry portals. While scanning such storage devices is always recommended, sanitization provides additional assurance that the devices are free of malicious code to include code capable of initiating zero-day attacks. Organizations consider nondestructive sanitization of portable storage devices when such devices are first purchased from the manufacturer or vendor prior to initial use or when organizations lose a positive chain of custody for the devices.	St-3				х	
MP-6 (4)	2	Media Protection Media Sanitization Controlled	Х								[Withdrawn: Incorporated into MP-6]
MP-6 (5)	2	Unclassified Information Media Protection Media Sanitization Classified Information	Х								[Withdrawn: Incorporated into MP-6]
MP-6 (6)	2	Media Protection Media Sanitization Media Destruction	Х								[Withdrawn: Incorporated into MP-6]
MP-6 (7)	2	Media Protection Media Sanitization Dual Authorization		The organization enforces dual authorization for the sanitization of [Assignment: organization-defined information system media].	Organizations employ dual authorization to ensure that information system media sanitization cannot occur unless two technically qualified individuals conduct the task. Individuals sanitizing information system media posses sufficient skills/expertise to determine if the proposed sanitization reflects applicable federal/organizational standards, policies, and procedures. Dual authorization also helps to ensure that sanitization occurs as intended, both protecting against errors and false claims of having performed the sanitization actions. Dual authorization may also be known as two-person control.	AC-3,MP-2					
MP-6 (8)	2	Media Protection Media Sanitization Remote Purging / Wiping of Information		The organization provides the copability to purge/wipe information from [Assignment: organization-defined information systems, system components, or devices] either remotely or under the following conditions: [Assignment: organization-defined conditions].	This control enhancement protects dato/information on organizational information systems, system components, or devices (e.g., mobile devices) if such systems, components, or devices are obtained by unauthorized individuals. Remote purge/wipe commands require strong authentication to mitigate the risk of unauthorized individuals purging/wiping the system/component/device. The purge/wipe function can be implemented in a variety of ways including, for example, by overwriting data/information multiple times or by destroying the key necessary to decrypt encrypted data.						
MP-7	1	Media Protection Media Use		The organization [Selection: restricts; prohibits] the use of [Assignment: organization-defined types of information system media] on [Assignment: organization-defined information systems or system components] using [Assignment: organization-defined security safeguards].			P1 X	x		x	
MP-7 (1)	2	Media Protection Media Use Prohibit Use Without Owner		The organization prohibits the use of portable storage devices in organizational information systems when such devices have no identifiable owner.	Requiring identifiable owners (e.g., individuals, organizations, or projects) for portable storage devices reduces the risk of using such technologies by allowing organizations to assign responsibility and accountability for addressing known vulnerabilities in the devices (e.g., malicious code insertion). PE-3 (5)	2	Access Control Lockable Casings Physical and Environmental Protection Physical Access Control Tamper Protection		information system components from unauthorized physical access. The organization employs Assignment: organization-defined security safequards to Selection fone or more): detect; prevent physical tampering or alteration of Assignment: organization-defined hardware components within the information system.	Organizations may implement tamper detection/prevention at selected hardware components or tamper detection at some components and tamper prevention at other components. Tamper detection/prevention activities can employ many types of antitamper technologies including, for example, tamper-detection seals and anti-tamper coatings. Anti-tamper programs help to detect hardware alterations through counterfeiting and other supply-tami-related flow.						
PE-3 (6)		Physical and Environmental Protection Physical Access Control Facility Penetration Testing		The organization employs a penetration testing process that includes [Assignment: organization- defined frequency], unannounced attempts to bypass or circumvent security controls associated with physical access points to the facility.		CA-2,CA-7					
PE-4	1	Physical and Environmental Protection Access Control for Transmission Medium		The organization controls physical access to [Assignment: organization-defined information system distribution and transmission lines] within organizational facilities using [Assignment: organization-defined security safeguards].		MP-2,MP-4,PE-2,PE- 3,PE-5,SC-7,SC-8	P1	x		х	
PE-5	1	Physical and Environmental Protection Access Control for Output Devices		The organization controls physical access to information system output devices to prevent unauthorized individuals from obtaining the output.	Controlling physical access to output devices includes, for example, placing output devices in locked rooms or other secured areas and allowing access to authorized individuals only, and placing output devices in locations that can be monitored by organizational personnel. Monitors, printers, copiers, scanners, facsimile machines, and audio devices are examples of information system output devices.		P2	x		Х	
PE-5 (1)	2	Physical and Environmental Protection Access Control for Output Devices Access to Output by Authorized Individuals		The organization: (a) Controls physical access to output from [Assignment: organization-defined output devices]; and (b) Ensures that only authorized individuals receive output from the device.	Controlling physical access to selected output devices includes, for example, placing printers, copiers, and facsimile machines in controlled areas with keypad access controls or limiting access to individuals with certain types of badges.						
PE-5 (2)	2	Physical and Environmental Protection Access Control for Output Devices Access to Output by Individual Identity		The information system: (a) Controls physical access to output from [Assignment: organization-defined output devices]; and (b) Links individual identity to receipt of the output from the device.	Controlling physical access to selected output devices includes, for example, installing security functionality on printers, copiers, and facsimile machines that allows organizations to implement authentication (e.g., using a PIN or hardware token) on output devices prior to the release of output to individuals.						
PE-5 (3)	2	Physical and Environmental Protection Access Control for Output Devices Marking Output Devices		The organization marks [Assignment: organization-defined information system output devices] indicating the appropriate security marking of the information permitted to be output from the device.	Outputs devices include, for example, printers, monitors, facsimile machines, scanners, copiers, and audio devices. This control enhancement is generally applicable to information system output devices other than mobiles devices.						
PE-6	1	Physical and Environmental Protection Monitoring Physical Access		The organization: a. Monitors physical access to the facility where the information system resides to detect and respond to physical security incidents; b. Reviews physical access logs [Assignment: organization-defined frequency] and upon occurrence of [Assignment: organization-defined events or potential indications of events]; and c. Coordinates results of reviews and investigations with the organizational incident response capability.	Organizational incident response capabilities include investigations of and responses to detected physical security incidents. Security incidents include, for example, apparent security violations or suspicious physical access activities. Suspicious physical access	CA-7,IR-4,IR-8	P1	x x		х	
PE-6 (1)	2	Physical and Environmental Protection Monitoring Physical Access Intrusion Alarms / Surveillance Equipment		The organization monitors physical intrusion alarms and surveillance equipment.				X		Х	
PE-6 (2)	2	Physical and Environmental Protection Monitoring Physical Access Automated Intrusion Recognition / Responses		The organization employs automated mechanisms to recognize [Assignment: organization-defined classes/types of intrusions] and initiate [Assignment: organization-defined response actions].		51-4					
PE-6 (3)	2	Physical and Environmental Protection Monitoring Physical Access Video Surveillance		The organization employs video surveillance of [Assignment: organization-defined operational areas] and retains video recordings for [Assignment: organization-defined time period].	This control enhancement focuses on recording surveillance video for purposes of subsequent review, if circumstances so warrant (e.g., a brack-in detected by other means). It does not require monitoring surveillance video although organizations may choose to do so. Note that there may be legal considerations when performing and retaining video surveillance, especially if such surveillance is in a public location.						
PE-6 (4)	2	Physical and Environmental Protection Monitoring Physical Access Monitoring Physical Access to Information Systems		The organization monitors physical access to the information system in addition to the physical access monitoring of the facility as [Assignment: organization-defined physical spaces containing one or more components of the information system].	This control enhancement provides additional monitoring for those areas within facilities where there is a concentration of information system components (e.g., server rooms, media storage areas, communications centers).	PS-2,PS-3				Х	
PE-7	1	Physical and Environmental Protection Visitor Control	Х								[Withdrawn: Incorporated into PE-2 and PE-3]
PE-8	1	Physical and Environmental Protection Visitor Access Records		The organization: a. Maintains visitor access records to the facility where the information system resides for [Assignment: organization-defined time period]; and b. Reviews visitor access records [Assignment organization-defined frequency].	Visitor access records include, for example, names and organizations of persons visiting, visitor signatures, forms of identification, dates of access, entry and departure times, purposes of visits, and names and organizations of persons visited. Visitor access records are not required for publicly accessible areas.		P3	х		х	
PE-8 (1)	2	Physical and Environmental Protection Visitor Access Records Automated Records Maintenance / Review		The organization employs automated mechanisms to facilitate the maintenance and review of visitor access records.	no required to patient accession treas					Х	
PE-8 (2)	2	Physical and Environmental Protection Visitor Access Records Physical Access Records	Х								[Withdrawn: Incorporated into PE-2]
PE-9	1	Physical and Environmental Protection Power Equipment and Cabling		The organization protects power equipment and power cabling for the information system from damage and destruction.	Organizations determine the types of protection necessary for power equipment and cabling employed at different locations both internal and external to organizational facilities and environments of operation. This includes, for example, generators and power cabling outside of buildings, internal cabling and uninterruptable power sources within an office or data center, and power sources for self-contained entities such as vehicles and satellites.	PE-4	P1	x		х	
PE-9 (1)	2	Physical and Environmental Protection Power Equipment and Cabling Redundant Cabling		The organization employs redundant power cabling paths that are physically separated by [Assignment: organization-defined distance].	Physically separate, redundant power cables help to ensure that power continues to flow in the event one of the cables is cut or otherwise damaged.						
PE-9 (2)	2	Physical and Environmental Protection Power Equipment and Cabling Automatic Voltage Controls		The organization employs automatic voltage controls for [Assignment: organization-defined critical information system components].							
PE-10	1	Physical and Environmental Protection Emergency Shutoff		The organization: a. Provides the capability of shutting off power to the information system or individual system components in emergency situations; b. Places emergency shutoff switches or devices in [Assignment: organization-defined location by information system or system component] to facilitate safe and easy access for personnel; and c. Protects emergency power shutoff capability from unauthorized activation.	This control applies primarily to facilities containing concentrations of information system resources including, for example, data centers, server rooms, and mainframe computer rooms.	PE-15	P1	x		х	
PE-10 (1)	2	Physical and Environmental Protection Emergency Shutoff Accidental / Unauthorized Activation	Х								[Withdrawn: Incorporated into PE-10]

PE-11 (2)		Physical and Environmental Protection Emergency Power Long-Term Alternate Power Supply - Self-Contained		The organization provides a long-term alternate power supply for the information system that is: (a) Self-contained; (b) Not reliant on external power generation; and (c) Capable of maintaining [Selection: minimally required operational capability; full operational capability] in the event of an extended loss of the primary power source.	generators with sufficient capacity to meet the needs of the organization. Long-term alternate power supplies for organizational information systems are either manually or automatically activated.						
PE-12	1	Physical and Environmental Protection Emergency Lighting		The organization employs and maintains automatic emergency lighting for the information system that activates in the event of a power outage or disruption and that covers emergency exits and evacuation routes within the facility.	This control applies primarily to facilities containing concentrations of information system resources including, for example, data centers, server rooms, and mainframe computer rooms.	CP-2,CP-7	P1	х	х	х	
PE-12 (1)	2	Physical and Environmental Protection Emergency Lighting Essential Missions / Business Functions		The organization provides emergency lighting for all areas within the facility supporting essential missions and business functions.							
PE-13	1	Physical and Environmental Protection Fire Protection		The organization employs and maintains fire suppression and detection devices/systems for the information system that are supported by an independent energy source.	This control applies primarily to facilities containing concentrations of information system resources including, for example, data centers, server rooms, and mainframe computer rooms. Fire suppression and detection devices/systems include, for example, sprinkler systems, handheld fire extinguishers, fixed fire hoses, and smoke detectors.		P1	х	х	х	
PE-13 (1)	2	Physical and Environmental Protection Fire Protection Detection Devices / Systems		The organization employs fire detection devices/systems for the information system that activate automatically and notify [Assignment: organization-defined personnel or roles] and [Assignment: organization-defined emergency responders] in the event of a fire.	Organizations can identify specific personnel, roles, and emergency responders in the event that individuals on the notification list must have appropriate access authorizations and/or clearances, for example, to obtain access to facilities where classified operations are taking place or where there are information systems containing classified information.					х	
PE-13 (2)	2	Physical and Environmental Protection Fire Protection Suppression Devices / Systems		The organization employs fire suppression devices/systems for the information system that provide automatic notification of any activation to Assignment: organization-defined personnel or roles) and [Assignment: organization-defined emergency responders].	Organizations can identify specific personnel, roles, and emergency responders in the event that individuals on the notification list must have appropriate access suthorizations and/or clearances, for example, to obtain access to facilities where classified operations are taking place or where there are information systems containing classified information.					х	
PE-13 (3)	2	Physical and Environmental Protection Fire		The organization employs an automatic fire suppression capability for the information system					х	х	
PE-13 (4)	2	Protection Automatic Fire Suppression Physical and Environmental Protection Fire Protection Inspections		when the facility is not staffed on a continuous basis. The organization ensures that the facility undergoes [Assignment: organization-defined frequency] inspections by authorized and qualified inspectors and resolves identified deficiencies within [Assignment: organization-defined time period].							
PE-14	1	Physical and Environmental Protection Temperature and Humidity Controls		The organization: a. Maintains temperature and humidity levels within the facility where the information system resides at [Assignment: organization-defined acceptable levels]; and b. Monitors temperature and humidity levels [Assignment: organization-defined frequency].	This control applies primarily to facilities containing concentrations of information system resources, for example, data centers, server rooms, and mainframe computer rooms.	AT-3	P1	х	х	х	
PE-14 (1)	2	Physical and Environmental Protection Temperature and Humidity Controls Automatic Controls		The organization employs automatic temperature and humidity controls in the facility to prevent fluctuations potentially harmful to the information system.							
PE-14 (2)	2	Physical and Environmental Protection Temperature and Humidity Controls Monitoring with Alarms / Notifications		The organization employs temperature and humidity monitoring that provides an alarm or notification of changes potentially harmful to personnel or equipment.							
PE-15	1	Physical and Environmental Protection Water Damage Protection		The organization protects the information system from damage resulting from water leakage by providing master shutoff or isolation valves that are accessible, working properly, and known to kep personnel.		AT-3	P1	X	х	х	
PE-15 (1)	2	Physical and Environmental Protection Water Damage Protection Automation Support		The organization employs automated mechanisms to detect the presence of water in the vicinity of the information system and alerts [Assignment: organization-defined personnel or roles].	Automated mechanisms can include, for example, water detection sensors, alarms, and notification systems.					Х	
PE-16	1	Physical and Environmental Protection Delivery and Removal		The organization authorizes, monitors, and controls [Assignment: organization-defined types of information system components] entering and exiting the facility and maintains records of those items.	Effectively enforcing authorizations for entry and exit of information system components may require restricting access to delivery areas and possibly isolating the areas from the information system and media libraries.	CM-3,MA-2,MA- 3,MP-5,SA-12	P2	х	х	х	
PE-17	1	Physical and Environmental Protection Alternate Work Site		The organization: a. Employs [Assignment: organization-defined security controls] at alternate work sites; b. Assesses as feasible, the effectiveness of security controls at alternate work sites; and c. Provides a means for employees to communicate with information security personnel in case of security incidents or problems.	Alternate work sites may include, for example, government facilities or private residences of employees. While commonly distinct from alternative processing sites, alternate work sites may provide readily available alternate locations as part of contingency operations.	AC-17,CP-7	P2		x	х	
PE-18	1	Physical and Environmental Protection Location of Information System Components		The organization positions information system components within the facility to minimize potential damage from [Assignment: organization-defined physical and environmental hazards] and to minimize the opportunity for unauthorized access.	Physical and environmental hazards include, for example, flooding, fire, tornados, earthquakes, hurricanes, acts of terrorism, vandalism, electromagnetic pulse, electrical interference, and other forms of incoming electromagnetic radiation. In addition, organizations consider the location of physical entry points where unauthorized individuals, while not being granted access, might nonetheless be in close proximity to information systems and therefore increase the potential for unauthorized access to organizational communications (e.g., through the use of wireless sniffers or microphones).	CP-2,PE-19,RA-3	P3			х	
PE-18 (1)	2	Physical and Environmental Protection Location of Information System Components Facility Site		The organization plans the location or site of the facility where the information system resides with regard to physical and environmental hazards and for existing facilities, considers the physical and environmental hazards in its risk miligation strategy.		PM-8					
PE-19	1	Physical and Environmental Protection Information Leakage		The organization protects the information system from information leakage due to electromagnetic signals emanations.	Information leakage is the intentional or unintentional release of information to an untrusted environment from electromagnetic signals emanations. Security categories or classifications of information systems (with respect to confidentiality) and organizational security policies guide the selection of security controls employed to protect systems against information leakage due to electromagnetic signals emanations.		PO				
PE-19 (1)	2	Physical and Environmental Protection Information Leakage National Emissions / Tempest Policies and Procedures		The organization ensures that information system components, associated data communications, and networks are protected in accordance with national emissions and TEMPEST policies and procedures based on the security category or classification of the information.

PL-8	1	Planning Information Security Architecture		The organization:	This control addresses actions taken by organizations in the design and development of information			V.Y	x	X	l l
	-	Training mornadon security Architecture		a. Develops an information security architecture for the information system that:	systems. The information security architecture at the individual information system level is	7.SA-5.SA-			l^	l^	
				a.1. Describes the overall philosophy, requirements, and approach to be taken with regard to	I	17,Appendix J					
				protecting the confidentiality, integrity, and availability of organizational information;	architecture described in PM-7 that is integral to and developed as part of the enterprise	17,Appendix 3					
				a.2. Describes how the information security architecture is integrated into and supports the	architecture. The information security architecture includes an architectural description, the						
				enterprise architecture; and	placement/allocation of security functionality (including security controls), security-related						
				a.3. Describes any information security assumptions about, and dependencies on, external	information for external interfaces, information being exchanged across the interfaces, and the						
					protection mechanisms associated with each interface. In addition, the security architecture can						
				services;	include other important security-related information, for example, user roles and access privileges						
				b. Reviews and updates the information security architecture [Assignment: organization-defined	assigned to each role, unique security requirements, the types of information processed, stored, and transmitted by the information system, restoration priorities of information and information						
				frequency] to reflect updates in the enterprise architecture; and							
				c. Ensures that planned information security architecture changes are reflected in the security plan,	becoming less common for organizations to control all information resources. There are going to be						
				the security Concept of Operations (CONOPS), and organizational procurements/acquisitions.	key dependencies on external information services and service providers. Describing such						
					dependencies in the information security architecture is important to developing a comprehensive						
					mission/business protection strategy. Establishing, developing, documenting, and maintaining under	-					
					configuration control, a baseline configuration for organizational information systems is critical to						
					implementing and maintaining an effective information security architecture. The development of						
					the information security architecture is coordinated with the Senior Agency Official for Privacy						
					(SAOP)/Chief Privacy Officer (CPO) to ensure that security controls needed to support privacy						
					requirements are identified and effectively implemented. PL-8 is primarily directed at organizations						
					(i.e., internally focused) to help ensure that organizations develop an information security architecture for the information system, and that the security architecture is integrated with or						
					tightly coupled to the enterprise architecture through the organization-wide information security						
			I		architecture. In contrast, SA-17 is primarily directed at external information technology				1	1	
			I		product/system developers and integrators (although SA-17 could be used internally within				1	1	
			I		organizations for in-house system development). SA-17, which is complementary to PL-8, is selected				1	1	
					when organizations outsource the development of information systems or information system						
					components to external entities, and there is a need to demonstrate/show consistency with the						
					organization's enterprise architecture and information security architecture.						
PL-8 (1)	2	Planning Information Security Architecture		The organization designs its security architecture using a defense-in-depth approach that:	Organizations strategically allocate security safeguards (procedural, technical, or both) in	SC-29 SC-36					
(1)		Defense-In-Depth			the security architecture so that adversaries have to overcome multiple safeguards to	22,30 30					
				defined locations and architectural layers]; and	achieve their objective. Requiring adversaries to defeat multiple mechanisms makes it						
				(b) Ensures that the allocated security safeguards operate in a coordinated and mutually	more difficult to successfully attack critical information resources (i.e., increases adversary						
				reinforcing manner.	work factor) and also increases the likelihood of detection. The coordination of allocated						
				reinforcing maillet.	work factor) and also increases the likelihood of detection. The coordination of allocated safeguards is essential to ensure that an attack that involves one safeguard does not						
					create adverse unintended consequences (e.g., lockout, cascading alarms) by interfering						
					with another safeguard. Placement of security safeguards is a key activity. Greater asset						
					criticality or information value merits additional layering. Thus, an organization may						
					choose to place anti-virus software at organizational boundary layers, email/web servers,						
					notebook computers, and workstations to maximize the number of related safeguards						
					adversaries must penetrate before compromising the information and information						
					systems.						
PL-8 (2)	-	Non-in-life County County And in-to-		The second state of the se	Different in the state of the s	SA-12					
PL-8 (2)		Planning Information Security Architecture			Different information technology products have different strengths and weaknesses.	5A-12					
		Supplier Diversity		to [Assignment: organization-defined locations and architectural layers] are obtained from	Providing a broad spectrum of products complements the individual offerings. For example,						
				different suppliers.	vendors offering malicious code protection typically update their products at different						
					times, often developing solutions for known viruses, Trojans, or worms according to their						
					priorities and development schedules. By having different products at different locations						
					(e.g., server, boundary, desktop) there is an increased likelihood that at least one will						
					detect the malicious code.						
									_	_	
PL-9	1	Planning Central Management		The organization centrally manages [Assignment: organization-defined security controls and related			P0				
				processes].	selected security controls and related processes. Central management includes planning,						
					implementing, assessing, authorizing, and monitoring the organization-defined, centrally						
					managed security controls and processes. As central management of security controls is						
					generally associated with common controls, such management promotes and facilitates						
					standardization of security control implementations and management and judicious use of						
					organizational resources. Centrally-managed security controls and processes may also meet						
					independence requirements for assessments in support of initial and ongoing authorizations						
					to operate as part of organizational continuous monitoring. As part of the security control						
					selection process, organizations determine which controls may be suitable for central						
					management based on organizational resources and capabilities. Organizations consider						
					that it may not always be possible to centrally manage every aspect of a security control. In						
					such cases, the security control is treated as a hybrid control with the control managed and						
					implemented either centrally or at the information system level. Controls and control						
					enhancements that are candidates for full or partial central management include, but are						
					not limited to: AC-2 (1) (2) (3) (4); AC-17 (1) (2) (3) (9); AC-18 (1) (3) (4) (5); AC-19 (4); AC-						
					22; AC-23; AT-2 (1) (2); AT-3 (1) (2) (3); AT-4; AU-6 (1) (3) (5) (6) (9); AU-7 (1) (2); AU-11, AU

				guidelines that apply to insider threat programs in classified environments can also be employed effectively to improve the security of Controlled Unclassified Information in non-national security	13,CA-7,IA-4,IR-4,MP-					
				effectively to improve the security of Controlled Unclassified Information in non-national security systems. Insider threat programs include security controls to detect and prevent malicious insider	7,PE-2,PS-3,PS-4,PS-					
				activity through the centralized integration and analysis of both technical and non-technical	5,PS-8,SC-7,SC-38,SI- 4.PM-1.PM-14					
				information to identify potential insider threat concerns. A senior organizational official is	,					
				designated by the department/agency head as the responsible individual to implement and provide oversight for the program. In addition to the centralized integration and analysis						
				provide oversight for the program. In addition to the centralized integration and analysis capability, insider threat programs as a minimum, prepare department/agency insider threat						
				policies and implementation plans, conduct host-based user monitoring of individual employee						
				activities on government-owned classified computers, provide insider threat awareness training						
				to employees, receive access to information from all offices within the department/agency (e.g.,						
				human resources, legal, physical security, personnel security, information technology, information system security, and law enforcement) for insider threat analysis, and conduct self-assessments of						
				department/agency insider threat posture. Insider threat programs can leverage the existence of						
				incident handling teams organizations may already have in place, such as computer security						
				incident response teams. Human resources records are especially important in this effort, as there						
				is compelling evidence to show that some types of insider crimes are often preceded by nontechnical behaviors in the workplace (e.g., ongoing patterns of disgruntled behavior and						
				conflicts with coworkers and other colleagues). These precursors can better inform and guide						
				organizational officials in more focused, targeted monitoring efforts. The participation of a legal						
				team is important to ensure that all monitoring activities are performed in accordance with						
				appropriate legislation, directives, regulations, policies, standards, and guidelines.						
PM-13	1	Program Management Information Security	The organization establishes an information security workforce development and improvement	Information security workforce development and improvement programs include, for	AT-2.AT-3				lo.	rogram Management Controls]
. 141-13	•	Workforce	program.	example: (i) defining the knowledge and skill levels needed to perform information security	7.12,A1-3				I _P	nogram management controls
				duties and tasks; (ii) developing role-based training programs for individuals assigned						
				information security roles and responsibilities; and (iii) providing standards for measuring						
				and building individual qualifications for incumbents and applicants for information security-						
				related positions. Such workforce programs can also include associated information security career paths to encourage: (i) information security professionals to advance in the field and						
				fill positions with greater responsibility; and (ii) organizations to fill information security-						
				related positions with qualified personnel. Information security workforce development and						
				improvement programs are complementary to organizational security awareness and						
				training programs. Information security workforce development and improvement programs focus on developing and institutionalizing core information security capabilities of selected						
				personnel needed to protect organizational operations, assets, and individuals.

				Organizations share threat, vulnerability, and incident information consistent with						
				applicable federal laws, Executive Orders, directives, policies, regulations, standards, and euidance.						

PM-16	1	Control Name Withdir Program Management Threat Awareness Program	The organization implements a threat awareness program that includes a cross-organization information-sharing capability.	Supplemental Guidance Because of the constantly changing and increasing sophistication of adversaries, especially the advanced persistent threat (APT), it is becoming more likely that adversaries may successfully breach or compromise organizational information systems. One of the best techniques to address this concern is for organizations to share threat information. This can include, for example, sharing threat events (i.e., tactics, techniques, and procedures) that organizations have experienced, mitigations that organizations have found are effective against certain types of threats, threat infelligence (i.e., indications and warnings about threats that are likely to occur). Threat information sharing may be bilateral (e.g., government-commercial cooperatives, government-government cooperatives), or multilateral (e.g., organizations taking part in threat-sharing consortia). Threat information may be highly sensitive requiring special agreements and protection, or less sensitive and freely shared. PS PS-1	1	Personnel Security Personnel Security Policy and Procedures	The organization: a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a.1. A personnel security policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance, and a.2. Procedures to facilities the implementation of the personnel security policy and associated personnel security controls; and b. Reviews and updates the current: b.1. Personnel security policy [Assignment: organization-defined frequency]; and b.2. Personnel security procedures [Assignment: organization-defined frequency].	This control addresses the establishment of policy and procedures for the effective implementation of selected security controls and control enhancements in the PS family. Policy and procedures reflect applicable federal laws, Executive Orders, directives, regulations, policies, standards, and guidance. Security program policies and procedures at the organization level may make the need for system-specific policies and procedures unnecessary. The policy can be included as part of the general information security policy for organizations or conversely, can be represented by multiple policies reflecting the complex nature of certain organizations. The procedures can be established for the security program in general and for particular information systems, if needed. The organizational risk management strategy is a key factor in establishing policy and procedures.	PM-9	P1	X	Х	х	
PS-2	1	Personnel Security Position Risk Designation	The organization: a. Assigns a risk designation to all organizational positions; b. Establishes screening criteria for individuals filling those positions; and c. Reviews and updates position risk designations (Assignment: organization-defined frequency).	Position risk designations reflect Office of Personnel Management policy and guidance. Risk designations can guide and inform the types of authorizations individuals receive when accessing organizational information and information systems. Position screening criteria include explicit information security role appointment requirements (e.g., training, security clearances).	AT-3,PL-2,PS-3	P1	х	х	х	
PS-3	1	Personnel Security Personnel Screening	The organization: a. Screens individuals prior to authorizing access to the information system; and b. Rescreens individuals according to [Assignment: organization-defined conditions requiring rescreening and, where rescreening is so indicated, the frequency of such rescreening].		AC-2,IA-4,PE-2,PS-2	P1	х	х	Х	
PS-3 (1)		Personnel Security Personnel Screening Classified Information	The organization ensures that individuals accessing an information system processing, storing, or transmitting classified information are cleared and indoctrinated to the highest classification leve of the information to which they hove access on the system.		AC-3,AC-4					
PS-3 (2)	2	Personnel Security Personnel Screening Formal Indoctrination	The organization ensures that individuals accessing an information system processing, storing, or transmitting types of classified information which require formal indoctrination, are formally indoctrinated for all of the relevant types of information to which they have access on the system.	Types of classified information requiring formal indoctrination include, for example, Special Access Program (SAP), Restricted Data (RD), and Sensitive Compartment Information (SCI).	AC-3,AC-4					
PS-3 (3)		Personnel Security Personnel Screening Information with Special Protection Measures	The organization ensures that individuals accessing an information system processing, storing, or transmitting information requiring special protection: (ii) have valid access authorizations that are demonstrated by assigned official government duties; and (ii) Sustify (Assignment: organization-defined additional personnel screening criteria).	Unclassified Information (CUI) and Sources and Methods Information (SAMI). Personnel security criteria include, for example, position sensitivity background screening requirements.						
PS-4		Personnel Security Personnel Termination	The organization, upon termination of individual employment: a. Disables information system access within [Assignment: organization-defined time period]; b. Terminates/revokes any authenticators/credentials associated with the individual; c. Conducts exit interviews that include a discussion of [Assignment: organization-defined information security topics]; d. Retrieves all security-related organizational information system-related property; e. Retains access to organizational information and information systems formerly controlled by terminated individual; and f. Notifies [Assignment: organization-defined personnel or roles] within [Assignment: organization-defined time period].	tokens, system administration technical manuals, keys, identification cards, and building passes. Exit interviews ensure that terminated individuals understand the security constraints imposed by being former employees and that proper accountability is achieved for information system-related property. Security topics of interest at cell interviews can include, for example, reminding terminated individuals of nondisclosure agreements and potential limitations on future employment. Exit interviews may not be possible for some terminated individuals, for example, in cases related to job abandomnent, illnesses, and nonavailability of supervisors. Exit interviews are important for individuals with security clearances. Timely execution of termination actions is essential for individuals terminated for cause. In certain situations, organizations consider disabling the information system accounts of individuals that are being terminated prior to the individuals being notified.	AC-2,IA-4,PE-2,PS- 5,PS-6	P1	x	x	х	
PS-4 (1)		Personnel Security Personnel Termination Post- Employment Requirements	The organization: (a) Notifies terminated individuals of applicable, legally binding post-employment requirements for the protection of organizational information; and (b) Requires terminated individuals to sign an acknowledgment of post-employment requirements as part of the organizational termination process.	Organizations consult with the Office of the General Counsel regarding matters of post- employment requirements on terminated individuals.						
PS-4 (2)	2	Personnel Security Personnel Termination Automated Notification	The organization employs outomated mechanisms to notify (Assignment: organization-defined personnel or roles] upon termination of an individual.	In organizations with a large number of employees, not all personnel who need to know about termination actions receive the appropriate notifications' or J such notifications are received, they may not occur in a timely manner. Automated mechanisms can be used to send automatic alerts or notifications to specific organizational personnel or roles (e.g., management personnel, supervisors, personnel security officers, information security afficers, systems administrators, or information technology administrators) when individuals are terminated. Such automatic alerts or notifications can be conveyed in a variety of ways, including, for example, telephonically, via electronic mail, via text message, or via websites.					x	
PS-5	1	Personnel Security Personnel Transfer	The organization: a. Reviews and confirms ongoing operational need for current logical and physical access authorizations to information systems/facilities when individuals are reassigned or transferred to other positions within the organization; b. Initiates [Assignment: organization-defined fransfer or reassignment actions] within [Assignment: organization-defined time period following the formal transfer action]; c. Modifies access authorization as needed to correspond with any changes in operational need du to reassignment or transfer; and d. Notifies [Assignment: organization-defined personnel or roles] within [Assignment: organization-defined time period].	This control applies when reassignments or transfers of individuals are permanent or of such extended durations as to make the actions warranted. Organizations define actions appropriate for the types of reassignments or transfers, whether permanent or extended. Actions that may be required for personnel transfers or reassignments to other positions within organizations include, for example: (i) returning old and issuing new keys, identification cards, and building passes; (ii) closing information system accounts and establishing new accounts; (iii) changing information system access authorizations (i.e., privileges); and (vi) providing for access to official records to which individuals had access at	AC-2,IA-4,PE-2,PS-4	P2	х	х	х

RA-2	1	Risk Assessment Security Categorization		The organization:	Clearly defined authorization boundaries are a prerequisite for effective security	CM-8,MP-4,RA-3,SC-	P1	х	х	х	
				a. Categorizes information and the information system in accordance with applicable federal laws,	categorization decisions. Security categories describe the potential adverse impacts to	7					
				Executive Orders, directives, policies, regulations, standards, and guidance;	organizational operations, organizational assets, and individuals if organizational						
				 b. Documents the security categorization results (including supporting rationale) in the security plan for the information system; and 	information and information systems are comprised through a loss of confidentiality, integrity, or availability. Organizations conduct the security categorization process as an						
				c. Ensures that the authorizing official or authorizing official designated representative reviews and							
				approves the security categorization decision.	information security officers, information system owners, mission/business owners, and						
					information owners/stewards. Organizations also consider the potential adverse impacts to						
					other organizations and, in accordance with the USA PATRIOT Act of 2001 and Homeland Security Presidential Directives, potential national-level adverse impacts. Security						
					categorization processes carried out by organizations facilitate the development of						
					inventories of information assets, and along with CM-8, mappings to specific information						
					system components where information is processed, stored, or transmitted.						
RA-3	1	Risk Assessment Risk Assessment		The organization:	Clearly defined authorization boundaries are a prerequisite for effective risk assessments.	RA-2,PM-9	P1	х	х	х	
				a. Conducts an assessment of risk, including the likelihood and magnitude of harm, from the	Risk assessments take into account threats, vulnerabilities, likelihood, and impact to						
				unauthorized access, use, disclosure, disruption, modification, or destruction of the information	organizational operations and assets, individuals, other organizations, and the Nation based						
				system and the information it processes, stores, or transmits; b. Documents risk assessment results in [Selection: security plan; risk assessment report;	on the operation and use of information systems. Risk assessments also take into account risk from external parties (e.g., service providers, contractors operating information systems						
				Documents risk assessment results in [selection: security plan; risk assessment report; [Assignment: organization-defined document]];	on behalf of the organization, individuals accessing organizational information systems,						
				c. Reviews risk assessment results [Assignment: organization-defined frequency];	outsourcing entities). In accordance with OMB policy and related E-authentication						
				d. Disseminates risk assessment results to [Assignment: organization-defined personnel or roles];	initiatives, authentication of public users accessing federal information systems may also be						
				e. Updates the risk assessment [Assignment: organization-defined frequency] or whenever there	required to protect nonpublic or privacy-related information. As such, organizational assessments of risk also address public access to federal information systems. Risk						
				are significant changes to the information system or environment of operation (including the	assessments (either formal or informal) can be conducted at all three tiers in the risk						
				identification of new threats and vulnerabilities), or other conditions that may impact the security	management hierarchy (i.e., organization level, mission/business process level, or						
				state of the system.	information system level) and at any phase in the system development life cycle. Risk						
					assessments can also be conducted at various steps in the Risk Management Framework, including categorization, security control selection, security control implementation,						
					security control assessment, information system authorization, and security control						
					monitoring. RA-3 is noteworthy in that the control must be partially implemented prior to						
					the implementation of other controls in order to complete the first two steps in the Risk						
					Management Framework. Risk assessments can play an important role in security control selection processes, particularly during the application of tailoring guidance, which includes						
					security control supplementation.

SA-4	1	System and Services Acquisition Acquisition Process	The organization includes the following requirements, descriptions, and criteria, explicitly or by reference, in the acquisition contract for the information systems, system component, or information system service in accordance with applicable federal laws, Executive Orders, direct policies, regulations, standards, guidelines, and organizational mission/business needs: a. Security functional requirements; b. Security strength requirements; c. Security assurance requirements; d. Security-related documentation requirements; e. Requirements for protecting security-related documentation; f. Description of the information system development environment and environment in which t system is intended to operate; and g. Acceptance criteria.	hardware, software, or firmware) that represent the building blocks of an information system, information system components include commercial information technology products. Security functional requirements include security capabilities, security functions, and security mechanisms. Security strength requirements associated with such capabilities, functions, and mechanisms include degree of correctness, completeness, resistence to direct attack, and resistance to tampering or bypass. Security assurance requirements include: (i) development processes, procedures, practices, and methodologies; and (ii) evidence from development and assessment activities providing grounds for confidence that the required security functionality has been interesting and this neutrino confidence that the required security functionality has been	CM-6,PL-2,PS-7,SA- 3,SA-5,SA-8,SA-11,SA 12		x x	x		
SA-4 (1)	2	System and Services Acquisition Acquisition Process Functional Properties of Security Controls	The organization requires the developer of the information system, system component, or information system service to provide a description of the functional properties of the security controls to be employed.	Functional properties of security controls describe the functionality (i.e., security capability, functions, or mechanisms) visible at the interfaces of the controls and specifically exclude functionality and data structures internal to the operation of the controls.	SA-5		х	Х		
SA-4 (2)	2	System and Services Acquisition Acquisition Process Design / Implementation information for Security Controls	The organization requires the developer of the information system, system component, or information system service to provide design and implementation information for the security controls to be employed that includes; Selection (one or more): executivy-elevant external syst interfaces; high-level design; low-level design; source code or hardware schematics; (Assignmen organization-defined design/implementation information)] at [Assignment: organization-defined level of detail].	documentation for security controls employed in organizational information systems, em system components, or information system services based on mission/business nt: requirements, requirements for trustworthiness/resiliency, and requirements for analysis	SA-5		x	X		
SA-4 (3)	2	System and Services Acquisition Acquisition Process Development Methods / Techniques / Practices	The organization requires the developer of the information system, system component, or information system service to demonstrate the use of a system development life cycle that includes Skasigment: organization-defined state-of-the-practice system/security engineering methods, software development methods, testing/evaluation/validation techniques, and quali control processes).	Following a well-defined system development life cycle that includes state-of-the-practice software development methods, system/security emplecering methods, quality control processes, and testing, evaluation, and validation techniques helps to reduce the number yand severity of latent errors within information systems, system components, and information system services. Reducing the number/severity of such errors reduces the number of vulnerabilities in those systems, components, and services.	SA-12					
SA-4 (4)	2	System and Services Acquisition Acquisition Process Assignment of Components to Systems							[v	Withdrawn: Incorporated into CM-8 (9)]
SA-4 (5)		System and Services Acquisition Acquisition Process System / Camponent / Service Configurations	The organization requires the developer of the information system, system component, or information system service to: (a) Deliver the system, component, or service with [Assignment: organization-defined security configurations] implemented; and (b) Use the configurations as the default for any subsequent system, component, or service reinstallation or upgrade.	(USGCB) and any limitations on functions, ports, protocols, and services. Security characteristics include, for example, requiring that all default passwords have been changed.	CM-8					
SA-4 (6)	2	System and Services Acquisition Acquisition Process Use of Information Assurance Products	The organization: (a) Employs only government off-the-shelf (GOTs) or commercial off-the-shelf (COTs) informat assurance (IA) and IA-enabled information technology products that compose an NSA-approve solution to protect classified information when the networks used to transmit the information at a lower classification level than the information being transmitted; and (b) Ensures that these products have been evaluated and/or validated by NSA or in accordance with NSA-approved procedures.	information by cryptographic means may be required to use NSA-approved key management.	SC-8,SC-12,SC-13

		Process NIAP-Approved Protection Profiles		(a) Limits the use of commercially provided information assurance (IA) and IA-enabled information technology products to those products that have been successfully evaluated against a National Information Assurance partnership (INIAP)-approved Protection Profile for a specific technology type. If Such a profile exists; and (b) Requires, If no NIAP-approved Protection Profile exists for a specific technology type but a commercially provided information technology product relies on cryptographic functionality to enforce its security policy, that the cryptographic module is FIPS-validated.							
SA-4 (8)	2	System and Services Acquisition Acquisition Process Continuous Monitoring Plan		The organization requires the developer of the information system, system component, or information system service to produce a plan for the continuous monitoring of security control effectiveness that contains (Assignment: organization-defined level of detail):	The objective of continuous manitoring plans is to determine if the complete set of alanned, required, and deployed security controls within the information system, system component, or information system service continuous monitoring plans include a sufficient level and beta loss that the court. Developer continuous monitoring plans include a sufficient level of detail such that the information can be incorporated into the continuous monitoring strategies and programs implemented by organizations.	CA-7					
SA-4 (9)	2	System and Services Acquisition Acquisition Process Functions / Ports / Protocols / Services in Use		The organization requires the developer of the information system, system component, or information system service to identify early in the system development life cycle, the functions, ports, protocols, and services intended for organizational use.	The identification of functions, ports, protocols, and services early in the system development life (cycle (e.g., during the initial requirements definition and design phases) allows organizations to influence the design of the information system, information system component, or information system service. This early involvement in the life cycle helps organizations to avoid or minimize the use of functions, ports, protocols, or services that pose unnecessarily high risks and understand the trade-offs involved in blocking specific ports, protocols, or services (or when requiring information system service providers to also so). Early identification of functions, ports, protocols, and services avoids costly retrofitting of security controls after the information system, system component, or information system services with organizations identifying only information system services with organizations identifying which functions, ports, protocols, and services are provided from external sources.	CM-7,SA-9			x	х	
SA-4 (10)	2	System and Services Acquisition Acquisition Process Use of Approved PIV Products		The organization employs only information technology products on the FIPS 201-approved products list for Personal Identity Verification (PIV) capability implemented within organizational		IA-2,IA-8		х	х	х	
SA-S	1	System and Services Acquisition Information System Documentation		Information systems. The organization: a. Obtains administrator documentation for the information system, system component, or information system service that describes: a. Detains administrator documentation for the information system, system component, or information system service that describes: a.1. Secure configuration, installation, and operation of the system, component, or service; a.2. Effective use and maintenance of security functions/mechanisms, and a.3. Known vulnerabilities regarding configuration and use of administrative (i.e., privileged) functions; b. Obtains user documentation for the information system, system component, or information system service that describes: b.1. User-accessible security functions/mechanisms and how to effectively use those security functions/mechanisms; b.2. Methods for user interaction, which enables individuals to use the system, component, or service in a more secure manner; and b.3. User responsibilities in maintaining the security of the system, component, or service; c. Documents attempts to obtain information system is either unavailable or nonexistent and takes [Assignment: organization-defined actions] in response; d. Protects documentation serviced, oi accordance with the risk management strategy; and e. Distributes documentation to [Assignment: organization-defined personnel or roles].	This control helps organizational personnel understand the implementation and operation of security controls associated with information systems, system components, and information system services. Organizations consider establishing specific measures to determine the quality/completeness of the content provided. The inability to obtain needed documentation may occur, for example, due to the age of the information system/component or lack of support from developers and contractors. In those situations, organizations may need to recreate selected documentation if such documentation is essential to the effective implementation or security controls. The level of protection provided for selected information system, component, or service documentation is commensurate with the security category or classification of the system. For example, documentation associated with a key DoD weapons system or command and control system would typically require a higher level of protection has a routine administrative system. Documentation that addresses information system vulnerabilities may also require an increased level of protection. Secure operation of the information system, includes, for example, initially starting the system and resuming secure system operation after any lapse in system operation.		P2	x	x	x

SA-8	1	Software System and Services Acquisition Security Engineering Principles		The organization applies information system security engineering principles in the specification, design, development, implementation, and modification of the information system.	Organizations apply security engineering principles primarily to new development information systems or systems undergoing major upgrades. For legacy systems, organizations apply security engineering principles to system upgrades and modifications to the extent feasible, given the current state of hardware, software, and firmware within those systems. Security engineering principles include, for example; (i) developing layered protections; (ii) establishing sound security policy, architecture, and controls as the foundation for design; (iii) incorporating security requirements into the system development life cycle; (iv) delineating physical and logical security boundaries; (v) ensuring that system developers are trained on how to build secure software; (vi) illoinering security controls to meet organizational and operational needs; (viii) performing threat modeling to identify use cases, threat agents, attack vectors, and attacks patterns as well as compensating controls and design patterns needed to mitigate risk; and (viii) reducing risk to acceptable levels, thus enabling informed risk management decisions. SA-9	1	System and Services Acquisition External	The organization:	External information system services are services that are implemented outside of the	CA-3,IR-7,PS-7	P1	X	х	Х	Notes
		Information System Services	a. Requires that providers of external information system services comply with organizational	authorization boundaries of organizational information systems. This includes services that	. , , .					
			information security requirements and employ [Assignment: organization-defined security controls							
			in accordance with applicable federal laws, Executive Orders, directives, policies, regulations,	require that organizations using external service providers that are processing, storing, or						
			standards, and guidance;	transmitting federal information or operating information systems on behalf of the federal						
			 Defines and documents government oversight and user roles and responsibilities with regard to external information system services; and 	agencies are required to meet. Organizations establish relationships with external service						
			c. Employs [Assignment: organization-defined processes, methods, and techniques] to monitor	providers in a variety of ways including, for example, through joint ventures, business						
			security control compliance by external service providers on an ongoing basis.	partnerships, contracts, interagency agreements, lines of business arrangements, licensing						
				agreements, and supply chain exchanges. The responsibility for managing risks from the use						
				of external information system services remains with authorizing officials. For services						
				external to organizations, a chain of trust requires that organizations establish and retain a						
				level of confidence that each participating provider in the potentially complex consumer- provider relationship provides adequate protection for the services rendered. The extent						
				and nature of this chain of trust varies based on the relationships between organizations						
				and the external providers. Organizations document the basis for trust relationships so the						
				relationships can be monitored over time. External information system services						
				documentation includes government, service providers, end user security roles and						
				responsibilities, and service-level agreements. Service-level agreements define expectations of performance for security controls, describe measurable outcomes, and identify remedies						
				and response requirements for identified instances of noncompliance.						
SA-9 (1)	2	System and Services Acquisition External Information System Services Risk Assessments /	The organization: (a) Conducts an organizational assessment of risk prior to the acquisition or outsourcing of	Dedicated information security services include, for example, incident monitoring, analysis and response, operation of information security-related devices such as firewalls, or key	CA-6,RA-3			1		
		Information System Services Risk Assessments / Organizational Approvals	(a) Conducts an organizational assessment of risk prior to the acquisition or outsourcing of dedicated information security services; and	and response, operation of information security-related devices such as firewalls, or key management services.						
		organizational Approvais	(b) Ensures that the acquisition or outsourcing of dedicated information security services is	management services.						
			approved by [Assignment: organization-defined personnel or roles].						<u>L</u> _	
SA-9 (2)	2	System and Services Acquisition External	The organization requires providers of [Assignment: organization-defined external information		CM-7			X	Х	
		Information System Services Identification of	system services] to identify the functions, ports, protocols, and other services required for the use	protocols, and services used in the provision of such services can be particularly useful						
		Functions / Ports / Protocols / Services	of such services.	when the need arises to understand the trade-offs involved in restricting certain functions/services or blocking certain ports/protocols.						
SA-9 (3)	2	System and Services Acquisition External	The organization establishes, documents, and maintains trust relationships with external service	The degree of confidence that the risk from using external services is at an acceptable level						
5,5,5,	-	Information System Services Establish / Maintain	providers based on [Assignment: organization-defined security requirements, properties, factors,	depends on the trust that organizations place in the external providers, individually or in				1		
1		Trust Relationship with Providers	or conditions defining acceptable trust relationships].	combination. Trust relationships can help organization to gain increased levels of						
1				confidence that participating service providers are providing adequate protection for the						
1				services rendered. Such relationships can be complicated due to the number of potential						
1				entities participating in the consumer-provider interactions, subordinate relationships and levels of trust, and the types of interactions between the parties, in some cases, the degree						
1				of trust is based on the amount of direct control organizations are able to exert on external						
1				service providers with regard to employment of security controls necessary for the						
1				protection of the service/information and the evidence brought forth as to the						
1				effectiveness of those controls. The level of control is typically established by the terms and						
1				conditions of the contracts or service-level agreements and can range from extensive						
1				control (e.g., negotiating contracts or agreements that specify security requirements for the providers) to very limited control (e.g., using contracts or service-level agreements to						
1				obtain commodity services such as commercial telecommunications services). In other						
1				cases, levels of trust are based on factors that convince organizations that required						
1				security controls have been employed and that determinations of control effectiveness						
1				exist. For example, separately authorized external information system services provided to						
1				organizations through well-established business relationships may provide degrees of trust						
1				in such services within the tolerable risk range of the organizations using the services. External service providers may also outsource selected services to other external entities.						
1				making the trust relationship more difficult and complicated to manage. Depending on the						
1				nature of the services, organizations may find it very difficult to place significant trust in						
1				external providers. This is not due to any inherent untrustworthiness on the part of						
1				providers, but to the intrinsic level of risk in the services.

SA-10	1	System and Services Acquisition Developer Configuration Management	The organization requires the developer of the information system, system component, or information system service to: a. Perform configuration management during system, component, or service [Selection (one or more): design; development; implementation; operation); b. Document, manage, and control the integrity of changes to [Assignment: organization-definer configuration items under configuration management]; c. Implement only organization-approved changes to the system, component, or service; d. Document approved changes to the system, component, or service and the potential security impacts of such changes; and e. Track security flaws and flaw resolution within the system, component, or service and report findings to [Assignment: organization-defined personnel].	relevant portions of the system hardware, software, and firmware. Maintaining the integrity of changes to the information system, information system component, or information	CM-3, CM-4, CM-9, SA- 12, SI-2	P1		х	
SA-10 (1)	2	System and Services Acquisition Developer Configuration Management Software / Firmware Integrity Verification	The organization requires the developer of the information system, system component, or information system service to enable integrity verification of software and firmware componen	This control enhancement allows organizations to detect unauthorized changes to software to and firmware components through the use of tools, techniques, and/or mechanisms provided by developers. Integrity checking mechanisms can also address counterfeiting of software and firmware components. Organizations verify the integrity of software and firmware components, for example, through secure one-way hashes provided by developers. Delivered software and firmware components also include any updates to such components.	SI-7				
SA-10 (2)	2	System and Services Acquisition Developer Configuration Management Alternative Configuration Management Processes	The organization provides an alternate configuration management process using organizationa personnel in the absence of a dedicated developer configuration management team.	I Alternate configuration management processes may be required, for example, when organizations use commercial off-the-shelf (COTS) information technology products. Alternate configuration management processes include organizational personnel that: (i) are responsible for reviewing/approximal proposed changes to information systems, system components, and information system services; and (ii) conduct security impact and pulse prior to the implementation of any changes to systems, components, or services (e.g., a configuration control board that considers security impacts of changes during development and includes representatives of both the organization and the developer, when applicable).					
SA-10 (3)	2	System and Services Acquisition Developer Configuration Management Hardware Integrity Verification	The organization requires the developer of the information system, system component, or information system service to enable integrity verification of hardware components.	This control enhancement allows organizations to detect unauthorized changes to hardware components through the use of lools, techniques, and/or mechanisms provided by developers. Organizations verify the integrity of hardware components, for example, with hard-to-copy lobels and verifiable serial numbers provided by developers, and by requiring the implementation of ant-timapre technologies. Delivered hardware components also include updates to such components.	SI-7				
SA-10 (4)	2	System and Services Acquisition Developer Configuration Management Trusted Generation	The organization requires the developer of the information system, system component, or information system service to employ tools for comparing newly generated versions of security- relevant hardware descriptions and software/firmware source and object code with previous versions.	This control enhancement addresses changes to hardware, software, and firmware components between versions during development. In contrast, SA-10 (1) and SA-10 (3) allow organizations to detect unutabraized changes to hardware, software, and firmware components through the use of tools, techniques, and/or mechanisms provided by developers.					
SA-10 (5)	2	System and Services Acquisition Developer Configuration Management Mapping Integrity for Version Control	The organization requires the developer of the information system, system component, or information system service to maintain the integrity of the mapping between the master build data (hardware drawings and software/firmware code) describing the current version of securit relevant hardware, software, and firmware and the on-site master copy of the data for the current version.	This control enhancement addresses changes to hardware, software, and firmware components during initial development and during system life cycle updates. Maintaining sy- the integrity between the moster copies of security-relevant hardware, software, and firmware (including designs and source code) and the equivalent data in master copies raite in operational environments is essential to ensure the availability of organizational information systems supporting critical missions and/or business functions.					
SA-10 (6)	2	System and Services Acquisition Developer Configuration Management Trusted Distribution	The organization requires the developer of the information system, system component, or information system service to execute procedures for ensuring that security-relevant hardware, software, and firmware updates distributed to the organization are exactly as specified by the moster copies.	The trusted distribution of security-relevant hardware, software, and firmware updates helps to ensure that such updates are faithful representations of the master copies maintained by the developer and have not been tampered with during distribution.					
5A-11	í	System and Services Acquisition Developer Security Testing and Evaluation	The organization requires the developer of the information system, system component, or information system service to: a. Create and implement a security assessment plan; b. Perform [Selection (one or more): unit; integration, system; regression] testing/evaluation at [Assignment: organization-defined depth and coverage]; c. Produce evidence of the execution of the security assessment plan and the results of the secution [Produce evidence]; d. Implement a verifiable flaw remediation process; and e. Correct flaws identified during security testing/evaluation.	Developmental security testing/evaluation occurs at all post-design phases of the system development life cycle. Such testing/evaluation confirms that the required security controls are implemented correctiv, poetrating as intended, enforcing the desired security ropicly, and meeting established security requirements. Security properties of information systems may be affected by the interconnection of system components or changes to those components. The properties of information systems may be affected by the interconnection of system components or changes to those components. 					operations, maintenance, and retirement). Protection of organizational information systems	15,SA-18,SA-19,SC-					
						29,SC-30,SC-38,SI-7					
					reduction of vulnerabilities at each phase of the life cycle and the use of complementary,						
					mutually reinforcing strategies to respond to risk. Organizations consider implementing a						
					standardized process to address supply chain risk with respect to information systems and system components, and to educate the acquisition workforce on threats, risk, and required						
					security controls. Organizations use the acquisition/procurement processes to require						
					supply chain entities to implement necessary security safeguards to: (i) reduce the likelihood						
					of unauthorized modifications at each stage in the supply chain; and (ii) protect information						
					systems and information system components, prior to taking delivery of such						
					systems/components. This control also applies to information system services. Security						
					safeguards include, for example: (i) security controls for development systems, development						
					facilities, and external connections to development systems; (ii) vetting development						
					personnel; and (iii) use of tamper-evident packaging during shipping/warehousing. Methods for reviewing and protecting development plans, evidence, and documentation are						
					commensurate with the security category or classification level of the information system.						
					Contracts may specify documentation protection requirements.						
SA-12 (1)	2	System and Services Acquisition Supply Chain		The organization employs [Assignment: organization-defined tailored acquisition strategies,	The use of acquisition and procurement processes by organizations early in the system	SA-19					
SA-12 (1)	2	Protection Acquisition Strategies / Tools /		contract tools, and procurement methods] for the purchase of the information system, system	the use of acquisition and procurement processes by organizations early in the system development life cycle provides an important vehicle to protect the supply chain.	SA-19					!
		Methods		component, or information system service from suppliers.	Organizations use available all-source intelligence analysis to inform the tailoring of						
				component, or injurnation system service from suppliers.	acquisition strategies, tools, and methods. There are a number of different tools and						
					techniques available (e.g., obscuring the end use of an information system or system						
					component, using blind or filtered buys). Organizations also consider creating incentives for						
					suppliers who: (i) implement required security safeguards; (ii) promote transparency into						
					their organizational processes and security practices; (iii) provide additional vetting of the						· ·
					processes and security practices of subordinate suppliers, critical information system						· ·
					components, and services; (iv) restrict purchases from specific suppliers or countries; and						· ·
					(v) provide contract language regarding the prohibition of tainted or counterfeit						!
					components. In addition, organizations consider minimizing the time between purchase decisions and required delivery to limit opportunities for adversaries to corrupt information						
					system components or products. Finally, organizations can use trusted/controlled						
					distribution, delivery, and warehousing options to reduce supply chain risk (e.g., requiring						
					tamper-evident packaging of information system components during shipping and						!
					warehousing).						
SA-12 (2)	2	System and Services Acquisition Supply Chain		The organization conducts a supplier review prior to entering into a contractual agreement to	Supplier reviews include, for example: (i) analysis of supplier processes used to design,						
		Protection Supplier Reviews		acquire the information system, system component, or information system service.	develop, test, implement, verify, deliver, and support information systems, system components, and information system services; and (ii) assessment of supplier training and						
					experience in developing systems, components, or services with the required security						
					capability. These reviews provide organizations with increased levels of visibility into						
					supplier activities during the system development life cycle to promote more effective						
					supply chain risk management. Supplier reviews can also help to determine whether						
					primary suppliers have security safeguards in place and a practice for vetting subordinate						
					suppliers, for example, second- and third-tier suppliers, and any subcontractors.

SA-12 (13)	2	System and Services Acquisition Supply Chain Protection Critical Information System		The organization employs [Assignment: organization-defined security safeguards] to ensure an adequate supply of [Assignment: organization-defined critical information system components].	Adversaries can attempt to impede organizational operations by disrupting the supply of critical information system components or corrupting supplier operations. Safeguards to						
1		Components		duequate supply of [Assignment, organization-defined critical information system components].	ensure adequate supplies of critical information system components include, for example:						
1		Components			(i) the use of multiple suppliers throughout the supply chain for the identified critical						
1					components; and (ii) stockpiling of spare components to ensure operation during mission-						
					critical times.						
SA-12 (14)	2	System and Services Acquisition Supply Chain		The organization establishes and retains unique identification of [Assignment: organization-	Knowing who and what is in the supply chains of organizations is critical to gaining visibility						
		Protection Identity and Traceability		defined supply chain elements, processes, and actors] for the information system, system	into what is happening within such supply chains, as well as monitoring and identifying						
				component, or information system service.	high-risk events and activities. Without reasonable visibility and traceability into supply						
					chains (i.e., elements, processes, and actors), it is very difficult for organizations to						
					understand and therefore manage risk, and to reduce the likelihood of adverse events.						
					Uniquely identifying acquirer and integrator roles, organizations, personnel, mission and						
					element processes, testing and evaluation procedures, delivery mechanisms, support						
					mechanisms, communications/delivery paths, and disposal/final disposition activities as						
					well as the components and tools used, establishes a foundational identity structure for						
					assessment of supply chain activities. For example, labeling (using serial numbers) and						
					tagging (using radio-frequency identification [RFID] tags) individual supply chain elements						
					including software packages, modules, and hardware devices, and processes associated						
					with those elements can be used for this purpose. Identification methods are sufficient to						
					support the provenance in the event of a supply chain issue or adverse supply chain event.						
SA-12 (15)	2	System and Services Acquisition Supply Chain		The organization establishes a process to address weaknesses or deficiencies in supply chain	Evidence generated during independent or organizational assessments of supply chain

5A-13	1	System and Services Acquisition		The organization: a. Describes the trustworthiness required in the (Assignment: organization-defined information)	This control helps organizations to make explicit trustworthiness decisions when designing, developing, and implementing information systems that are needed to conduct critical	RA-2,SA-4,SA-8,SA- 14.SC-3	PU				
		Trustworthiness			organizational missions/business functions. Trustworthiness is a characteristic/property of an	14,5C-3					
				system, information system component, or information system service] supporting its critical	information system that expresses the degree to which the system can be expected to preserve the						
				missions/business functions; and	confidentiality, integrity, and availability of the information it processes, stores, or transmits.						
				b. Implements [Assignment: organization-defined assurance overlay] to achieve such	Trustworthy information systems are systems that are capable of being trusted to operate within						
				trustworthiness.	defined levels of risk despite the environmental disruptions, human errors, and purposeful attacks						
					that are expected to occur in the specified environments of operation. Trustworthy systems are						
					important to mission/business success. Two factors affecting the trustworthiness of information						
					systems include: (i) security functionality (i.e., the security features, functions, and/or mechanisms						
					employed within the system and its environment of operation); and (ii) security assurance (i.e., the						
					grounds for confidence that the security functionality is effective in its application). Developers,						
					implementers, operators, and maintainers of organizational information systems can increase the level of assurance (and trustworthiness), for example, by employing well-defined security policy						
					models, structured and rigorous hardware, software, and firmware development techniques, sound						
					system/security engineering principles, and secure configuration settings (defined by a set of						
					assurance-related security controls in Appendix E). Assurance is also based on the assessment of						
					evidence produced during the system development life cycle. Critical missions/business functions						
					are supported by high-impact systems and the associated assurance requirements for such systems.						
					The additional assurance controls in Table E-4 in Appendix E (designated as optional) can be used to						
					develop and implement high-assurance solutions for specific information systems and system						
					components using the concept of overlays described in Appendix I. Organizations select assurance						
					overlays that have been developed, validated, and approved for community adoption (e.g., cross- organization, governmentwide), limiting the development of such overlays on an organization-by-						
					organization, governmentwide), limiting the development of such overlays on an organization-by- organization basis. Organizations can conduct criticality analyses as described in SA-14, to determine						
					the information systems, system components, or information system services that require high-						
					assurance solutions. Trustworthiness requirements and assurance overlays can be described in the						
					security plans for organizational information systems.						
SA-14	1	System and Services Acquisition Criticality		The organization identifies critical information system components and functions by performing a	Criticality analysis is a key tenet of supply chain risk management and informs the	CP-2,PL-2,PL-8,PM-	P0

The organization requires the developer of the information system, system component, or information system service to select and employ a security tracking tool for use during the development process.	design (CAD) systems. Reviews of development processes can include, for example, the use of maturity models to determine the potential effectiveness of such processes. Maintaining the integrity of changes to tools and processes enables accurate supply chain risk assessment and mitigation, and requires robust configuration control throughout the life cycle (including design, development, transport, delivery, integration, and maintenance) to track authorized changes and prevent unauthorized changes. Organizations use quality metrics to establish minimum acceptable levels of information system quality. Metrics may include quality gates which are collections of completion criterio ar sufficiency standards representing the satisfactory execution of particular phases of the system development project. A quality gate, for example, may require the elimination of all compiler warnings or an explicit determination that the warnings have no impact on the effectiveness of required security copobilities. During the execution phases of development projects, quality pates provide clear, unambipuous diadications of progress. Other metrics apply to the entire development project. These metrics can include defining the severity thresholds of vulnerabilities, for example, requiring no known vulnerabilities in the delivered information system with a Common Vulnerability Scoring System (CAS) severity of Medium or High. Information system development teams select and deploy security tracking took, including, flitering, and tracking of completed work items or tasks associated with system development provides developer input to the criticality analysis performed by regonizations is AS-41. Developer input is essential to such analysis because organizations.		P2		x	[With

A quality gate, for example, may require the elimination of all complier warnings or one explicit determination that the warnings have no impact on the effectiveness of required security cophilities. During the execution phases of development projects, quality gates provide clear, unambiguous indications of progress. Other metrics apply to the entire development project. These metrics can include defining the severity thresholds of vulnerabilities, for example, requiring no known vulnerabilities in the delivered information system development brown with a Common Vulnerability Scoring System (CVSS) severity of Medium or High. Information system development teams select and deploy security tracking took, including, for example, vulnerability voka item tracking gystems that facilitate assignment, sorting, filtering, and tracking of completed work items or tasks associated with system development processes. This control enhancement provides developer input to the criticality analysis performed by organizations in SA-14. Developer input is essential to such analysis because organizations way not have access to detailed design documentation for information system components that are developed as commercial off-the-shelf (C	SA-4,SA-14	P2		x	[With	
SA-15 (1) SA-15 (2) SA-15 (3)	2 2	Analysis Critical Components with No Viable Alternative Sourcing System and Services Acquisition Development Process, Standards, and Tools System and Services Acquisition Development Process, Standards, and Tools Quality Metrics System and Services Acquisition Development Process, Standards, and Tools Quality Tracking Tools System and Services Acquisition Development Process, Standards, and Tools Criticality Analysis System and Services Acquisition Development Process, Standards, and Tools Criticality Analysis System and Services Acquisition Development Process, Standards, and Tools Tritect Modeling	*	a. Requires the developer of the information system, system component, or information system service to follow a documented development process that: a.1. Explicitly addresses security requirements; a.2. Identifies the standards and tools used in the development process; a.3. Documents the specific tool options and tool configurations used in the development process; and a.4. Documents, manages, and ensures the integrity of changes to the process and/or tools used in development; and levelopment; and levelopment process, standards, tools, and tool options/configurations [Assignment: organization-defined frequency] to determine if the process, standards, tools, and tool options/configurations selected and employed can saits fy [Assignment: organization-defined security requirements]. The organization requires the developer of the information system, system component, or information system service to: (a) Define quality metrics at the beginning of the development process; and (b) Provide evidence of meeting the quality metrics (Selection (one or more): [Assignment: organization-defined frequency]; [Assignment: organization-defined program review milestones]; upon delivery]. The organization requires the developer of the information system, system component, or information system service to select and employ a security tracking tool for use during the development process. The organization requires the developer of the information system, system component, or information system service to select and employ a security tracking tool for use during the development process. The organization requires the developer of the information system, system component, or information system service to select and employ a security tracking tool for use during the development process. The organization requires the developer of the information system, system component, or information system service to select and employ a security tracking tool for use during the development process.	design (CAD) systems. Reviews of development processes can include, for example, the use of maturity models to determine the potential effectiveness of such processes. Maintaining the integrity of changes to tools and processes enables accurate supply chain risk assessment and mitigation, and requires robust configuration control throughout the life cycle (including design, development, transport, delivery, integration, and maintenance) to track authorized changes and prevent unauthorized changes. Organizations use quality metrics to establish minimum acceptable levels of information system quality. Metrics may include quality gates which are collections of completion criterio ar sufficiency standards representing the satisfactory execution of particular phases of the system development project. A quality gate, for example, may require the elimination of all complier warnings or one explicit determination that the warnings have no impact on the effectiveness of required security cophilities. During the execution phases of development projects, quality gates provide clear, unambiguous indications of progress. Other metrics apply to the entire development project. These metrics can include defining the severity thresholds of vulnerabilities, for example, requiring no known vulnerabilities in the delivered information system development brown with a Common Vulnerability Scoring System (CVSS) severity of Medium or High. Information system development teams select and deploy security tracking took, including, for example, vulnerability voka item tracking gystems that facilitate assignment, sorting, filtering, and tracking of completed work items or tasks associated with system development processes. This control enhancement provides developer input to the criticality analysis performed by organizations in SA-14. Developer input is essential to such analysis because organizations way not have access to detailed design documentation for information system components that are developed as commercial off-the-shelf (C	SA-4,SA-14	P2		×	[With	

			Withdrawn		Sunnlemental Guidance						
SA-15 (5)	2	System and Services Acquisition Development Process, Standards, and Tools Attack Surface Reduction	Withdrawn	Control Text The organization requires the developer of the information system, system component, or information system service to reduce attack surfaces to [Assignment: organization-defined thresholds].	Attack surface reduction is closely aligned with developer threat and vulnerability analyses and information system architecture and design. Attack surface reduction is a means of reducing risk to organizations by giving attackers less opportunity to exploit weeknesses or deficiencies (i.e., potential vulnerabilities) within information systems, information system components, and information system services. Attack surface reduction includes, for example, applying the principle of least privilege, employing layered defenses, applying the principle of least favrilege, employing layered defenses, applying the principle of least favrilege, employing layered defenses, applying the principle of least functionality (i.e., restricting ports, protocols, functions, and services), deprecating unsafe functions, and eliminating application programming interfaces (APIs) that are vulnerable to cyber attacks.		Priority	Low	Mod !	High	Notes
SA-15 (6)	2	System and Services Acquisition Development Process, Standards, and Tools Continuous Improvement		The organization requires the developer of the information system, system component, or information system service to implement an explicit process to continuously improve the development process.	Developers of information systems, information system components, and information system services consider the effectiveness/efficiency of current development processes for meeting quality objectives and addressing security copabilities in current threat environments.						
SA-15 (7)	2	System and Services Acquisition Development Process, Standards, and Tools Automated Vulnerability Analysis		The organization requires the developer of the information system, system component, or information system service to: (a) Perform on automated vulnerability analysis using [Assignment: organization-defined tools]; (b) Determine the exploitation potential for discovered vulnerabilities; (c) Determine potential risk mitigations for delivered vulnerabilities; and (d) Deliver the outputs of the tools and results of the analysis to [Assignment: organization-defined personnel or roles].		RA-5					
SA-15 (8)	2	System and Services Acquisition Development Process, Standards, and Tools Reuse of Threat / Vulnerability Information		The organization requires the developer of the information system, system component, or information system service to use threat modeling and vulnerability analyses from similar systems, components, or services to inform the current development process.	Analysis of vulnerabilities found in similar software applications can inform potential design or implementation issues for information systems under development. Similar information systems or system components may exist within developer organizations. Authoritative vulnerability information is available from a variety of public and private sector sources including, for example, the National Vulnerability Database.						
SA-15 (9)	2	System and Services Acquisition Development Process, Standards, and Tools Use of Live Data		The organization approves, documents, and controls the use of live data in development and test environments for the information system, system component, or information system service.	The use of live data in preproduction environments can result in significant risk to organizations. Organizations can minimize such risk by using test or dummy data during the development and testing of information systems, information system components, and information system services.						
SA-15 (10)		System and Services Acquisition Development Process, Standards, and Tools Incident Response Plan		The organization requires the developer of the information system, system component, or information system service to provide an incident response plan.	The incident response plan for developers of information systems, system components, and information system services is incorporated into organizational incident response plans to provide the type of incident response information not readily available to organizations. Such information may be extremely helpful, for example, when organizations respond to vulnerabilities in commercial off-the-sheff (COTS) information technology products.	IR-8					
SA-15 (11)	2	System and Services Acquisition Development Process, Standards, and Tools Archive Information System / Component		The organization requires the developer of the information system or system component to archive the system or component to be released or delivered together with the corresponding evidence supporting the final security review.	Archiving relevant documentation from the development process can provide a readily available baseline of information that can be helpful during information system/component upgrades or modifications.						
SA-16	1	System and Services Acquisition Developer- Provided Training		The organization requires the developer of the information system, system component, or information system service to provide [Assignment: organization-defined training] on the correct use and operation of the implemented security functions, controls, and/or mechanisms.	This control applies to external and internal (in-house) developers. Training of personnel is an essential element to external enfectiveness of security controls implemented within organizational information systems. Training options include, for example, classroom-style training, web-based/computer-based training, and hands- on training. Organizations can also request sufficient training materials from developers to conduct in-house training or offer self-training to organizational personnel. Organizations determine the type of training necessary and may require different types of training for different security functions, controls, or mechanisms.	, ,,	P2)	х	
SA-17	1	System and Services Acquisition Developer Security Architecture and Design		The organization requires the developer of the information system, system component, or information system service to produce a design specification and security architecture that: a. is consistent with and supportive of the organization's security architecture which is established within and is an integrated part of the organization's enterprise architecture; b. Accurately and completely describes the required security functionality, and the allocation of security controls among physical and logical components; and c. Expresses how individual security functions, mechanisms, and services work together to provide required security capabilities and a unified approach to protection.	Internal (in-house) development. In contrast, PL-8 is primarily directed at internal developers to help ensure that organizations develop an information security architecture and such security architecture is integrated or tightly coupled to the enterprise architecture. This distinction is important if/when organizations outsource the development of information systems, information system components, or information systems revices to	PL-8,PM-7,SA-3,SA-8	P1			х	
SA-17 (1)	2	System and Services Acquisition Developer Security Architecture and Design Formal Policy Model		The organization requires the developer of the information system, system component, or information system service to: (a) Produce, as an integral part of the development process, a formal policy model describing the [Assignment: organization-defined elements of organizational security policy] to be enforced; and (b) Prove that the Formal policy model is internally consistent and sufficient to enforce the defined elements of the organizational security policy when implemented.	policies). Organizations choose the particular formal modeling language and approach based on the nature of the behaviors/policies to be described and the available tools. Formal modeling tools include, for example, Gypsy and Zed.						
SA-17 (2)		System and Services Acquisition Developer Security Architecture and Design Security- Relevant Components		The organization requires the developer of the information system, system component, or information system service to: (a) Define security-relevant hardware, software, and firmware; and (b) Provide a rationale that the definition for security-relevant hardware, software, and firmware is complete.	information system, component, or service that must be trusted to perform correctly in order to maintain required security properties.	SA-5					
SA-17 (3)	2	System and Services Acquisition Developer Security Architecture and Design Formal Correspondence		The organization requires the developer of the information system, system component, or information system service to: (a) Produce, as an integral part of the development process, a formal top-level specification that specifies the interfaces to security-relevant hardware, software, and firmware in terms of exceptions, error messages, and effects: (b) Show via proof to the extent feasible with additional informal demonstration as necessary, that the formal top-level specification is consistent with the formal policy model; (c) Show via informal demonstration, that the formal top-level specification completely covers the interfaces to security-relevant hardware, software, and firmware; (d) Show that the formal top-level specification is an accurate description of the implemented security-relevant hardware, and firmware; and (e) Describe the security-relevant hardware, software, and firmware mechanisms not addressed in the formal top-level specification but strictly internal to the security-relevant hardware, software, and firmware.	demonstrates that the implementation is an accurate transformation of the model, and that any additional code or implementation details present have no impact on the behaviour so policies being modeled. Formal methods can be used to show that the high-level security properties are satisfied by the formal information system description, and that the formal system description is correctly implemented by a description of some lower level. for example a hardware description is correctly implemented by a description of some lower level. for example a hardware description. Consistency between the formal policy models is generally not amenable to being fully proven. Therefore, a combination of formal/informal methods may be needed to show such consistency. Consistency between the formal top-level specification and the implementation may require the use of an informal demonstration due to limitations in the	SA-S					

Control ID	Lovel	Control Name	Withdrawn	Control Toyt	Supplemental Guidance	Related Controls	Priority I	ow Mod	High	Notes
SA-17 (4)	2	System and Services Acquisition Developer Security Architecture and Design Informal Correspondence		The organization requires the developer of the information system, system component, or information system service to: (a) Produce, as an integral part of the development process, an informal descriptive top-level specification that specifies the interfaces to security-relevant hardware, software, and firmware in terms of exceptions, error messages, and effects; (b) Snow via [Selection: informal demonstration, convincing argument with formal policy model; (c) Snow via informal demonstration, that the descriptive top-level specification is consistent with the formal policy model; (c) Snow via informal demonstration, that the descriptive top-level specification completely covers the interfaces to security-relevant hardware, software, and firmware; (d) Snow that the descriptive top-level specification is an accurate description of the interfaces to security-relevant hardware, and firmware; and (e) Describe the security-relevant hardware, software, and firmware mechanisms not addressed in the descriptive top-level specification but strictly internal to the security-relevant hardware, software, and firmware.	Correspondence is an important part of the assurance gained through modeling. It demonstrates that the implementation is an accurate transformation of the model, and that any additional code or implementation details present has no impact on the behaviors or policies being modeled. Consistency between the descriptive top-level specification (i.e., high-level/low-level design) and the formal policy model is generally not amenable to being fully proven. Therefore, a combination of formal/informal methods may be needed to show such consistency. Hardware, software, and firmware mechanisms strictly internal to security-relevant hardware, software, and firmware include, for example, mapping registers and direct memory input/output.	SA-5				
SA-17 (5)	2	System and Services Acquisition Developer Security Architecture and Design Conceptually Simple Design		The organization requires the developer of the information system, system component, or information system service to: (a) Design and structure the security-relevant hardware, software, and firmware to use a complete, conceptually simple protection mechanism with precisely defined semantics; and (b) Internally structure the security-relevant hardware, software, and firmware with specific regard for this mechanism.		SC-3				
SA-17 (6)	2	System and Services Acquisition Developer Security Architecture and Design Structure for Testing		The organization requires the developer of the information system, system component, or information system service to structure security-relevant hardware, software, and firmware to facilitate testing.		SA-11				
SA-17 (7)	2	System and Services Acquisition Developer Security Architecture and Design Structure for Least Privilege		The organization requires the developer of the information system, system component, or information system service to structure security-relevant hardware, software, and firmware to facilitate controlling access with least privilege.		AC-5,AC-6				
SA-18	1	System and Services Acquisition Tamper Resistance and Detection		The organization implements a tamper protection program for the information system, system component, or information system service.	Anti-tamper technologies and techniques provide a level of protection for critical information systems, system components, and information technology products against a number of related threats including modification, reverse engineering, and substitution. Strong identification combined with tamper resistance and/or tamper detection is essential to protecting information systems, components, and products during distribution and when in use.	PE-3,SA-12,SI-7	PO			
SA-18 (1)	2	System and Services Acquisition Tamper Resistance and Detection Multiple Phases of SDLC		The organization employs anti-tamper technologies and techniques during multiple phases in the system development life cycle including design, development, integration, operations, and maintenance.	Organizations use a combination of hardware and software techniques for tamper resistance and detection. Organizations employ obfuscation and self-checking, for example, to make reverse engineering and modifications more difficult, time-consuming, and expensive for adversaries. Customization of information systems and system components can make substitutions easier to detect and therefore limit damage.	SA-3				
SA-18 (2)	2	System and Services Acquisition Tamper Resistance and Detection Inspection of Information Systems, Components, or Devices		The organization inspects (Assignment: organization-defined information systems, system components, or devices] [Selection (one or more): at random; at [Assignment: organization-defined frequency], upon [Assignment: organization-defined indications of need for inspection]] to detect tampering.	This control enhancement addresses both physical and logical tampering and is typically applied to mobile devices, notebook computers, or other system components taken out of organization-controlled areas. Indications of need for inspection include, for example, when individuals return from travel to high-risk locations.	Si-4				
SA-19	1	System and Services Acquisition Component Authenticity		The organization: a. Develops and implements anti-counterfeit policy and procedures that include the means to detect and prevent counterfeit components from entering the information system; and b. Reports counterfeit information system components to [Selection (one or more): source of counterfeit component; [Assignment: organization-defined external reporting organizations]; [Assignment: organization-defined personnel or roles]].	Sources of counterfeit components include, for example, manufacturers, developers, vendors, and contractors. Anti-counterfeiting policy and procedures support tamper resistance and provide a level of protection against the introduction of malicious code. External reporting organizations include, for example, US-CERT.	PE-3,SA-12,SI-7	PO			
SA-19 (1)	2	System and Services Acquisition Component Authenticity Anti-Counterfeit Training		The organization trains (Assignment: organization-defined personnel or roles) to detect counterfeit information system components (including hardware, software, and firmware).						
SA-19 (2)	2	System and Services Acquisition Component Authenticity Configuration Control for Component Service Repair		The organization maintains configuration control over [Assignment: organization-defined information system components] awaiting service/repair and serviced/repaired components awaiting return to service.						
SA-19 (3) SA-19 (4)	2	System and Services Acquisition Component Authenticity Component Disposal System and Services Acquisition Component		The organization disposes of information system components using [Assignment: organization- defined techniques and methods]. The organization scans for counterfeit information system components [Assignment: organization-	Proper disposal of information system components helps to prevent such components from entering the gray market.					
SA-20		Authenticity Anti-Counterfelt Scanning System and Services Acquisition Customized Development of Critical Components		defined frequency]. The organization re-implements or custom develops [Assignment: organization-defined critical information system components].	Organizations determine that certain information system components likely cannot be trusted due to specific threats to and vulnerabilities in those components, and for which there are no viable security controls to a dequately mitigate the resulting risk. Reinplementation or custom development of such components helps to satisfy requirements for higher assurance. This is accomplished by initiating changes to system components (including hardware, software, and firmware) such that the standard attacks by adversaries are less likely to succeed. In situations where no alternative sourcing is available and organizations choose not to re-implement or custom develop critical information system components, additional safeguards can be employed (e.g., enhanced auditing, restrictions on source code and system utility access, and protection from deletion of system and application files.	CP-2,SA-8,SA-14	PO			
SA-21		System and Services Acquisition Developer Screening		The organization requires that the developer of [Assignment: organization-defined information system, system component, or information system service]. A Have appropriate access authorizations as determined by assigned [Assignment: organization-defined official government duties]; and b. Satisfy [Assignment: organization-defined additional personnel screening criteria].	Because the information system, system component, or information system service may be employed in critical activities essential to the national and/or economic security interests of the United States, organizations have a strong interest in ensuring that the developer is trustworthy. The degree of trust required of the developer may need to be consistent with that of the individuals accessing the information system/component/service once deployed. Examples of authorization and personnel screening criteria include clearance, satisfactory background checks, citizenship, and nationality. Trustworthiness of developers may also include a review and analysis of company ownership and any relationships the company has with entities potentially affecting the quality/reliability of the systems, components, or services being developed.	PS-3,PS-7	PO			
SA-21 (1)	2	System and Services Acquisition Developer Screening Validation of Screening		The organization requires the developer of the information system, system component, or information system service take [Assignment: organization-defined actions] to ensure that the required access authorizations and screening criteria are satisfied.	Satisfying required access authorizations and personnel screening criteria includes, for example, providing a listing of all the individuals authorized to perform development activities on the selected information system, system component, or information system service so that organizations can validate that the developer has satisfied the necessary authorization and screening requirements.					

Control ID	Level	Control Name	halsoun	Control Tout	Supplemental Cuidance	Deleted Centrals	Deignites	Lew	Mod	High	Notes
SA-22	1	Control Name Wit System and Services Acquisition Unsupported System Components	andrawn -	Control Text The organization: a. Replaces information system components when support for the components is no longer available from the developer, vendor, or manufacturer; and b. Provides justification and documents approval for the continued use of unsupported system components required to satisfy mission/business needs.	Supplicational crutiering. Support for information system components includes, for example, software patches, firmware updates, replacement parts, and maintenance contracts. Unsupported components (e.g., when vendors are no longer providing critical software patches), provide a substantial opportunity for adversaries to exploit new weaknesses discovered in the currently installed components. Exceptions to replacing unsupported system components way include, for example, systems that provide critical mission/business capability where newer technologies are not available or where the systems are so isolated that installing replacement components is not an option.	PL-2,SA-3	Priority P0	EOW	Mod	ngn	
SA-22 (1)	2	System and Services Acquisition Unsupported System Components Alternative Sources for Continued Support		The organization provides [Selection (one or more): in-house support: [Assignment: organization-defined support from external providers]] for unsupported information system components.	This control enhancement addresses the need to provide continued support for selected information system components that are no longer supported by the original developers, vendors, or manufacturers when such components remain essential to mission/flusiness operations. Organizations can establish in-house support, for example, by developing customized patches for critical software components or secure the services of external providers who through contractual relationships, provide organing support for the designated unsupported components. Such contractual relationships can include, for example, Open Source Software value-added vendors.						
sc		System and Communications Protection									
SC-1	1	System and Communications Protection System and Communications Protection Policy and Procedures		The organization: a. Develops, documents, and disseminates to [Assignment: organization-defined personnel or roles]: a. 1. A system and communications protection policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and a.2. Procedures to facilitate the implementation of the system and communications protection policy and associated system and communications protection controls; and b. Reviews and updates the current. b. 1. System and communications protection policy [Assignment: organization-defined frequency]; and b. 2. System and communications protection procedures [Assignment: organization-defined frequency]; and	This control addresses the establishment of policy and procedures for the effective implementation of selected security controls and control enhancements in the SC family. Policy and procedures reflect applicable federal laws, Executive Orders, directives, regulations, policies, standards, and guidance. Security program policies and procedures at the organization level may make the need for system-specific policies and procedures unnecessary. The policy can be included as part of the general information security policy for organizations or conversely, can be represented by multiple policies reflecting the complex nature of certain organizations. The procedures can be established for the security program in general and for particular information systems, if needed. The organizational risk management strategy is a key factor in establishing policy and procedures.		P1	x	x	х	
SC-2	1	System and Communications Protection Application Partitioning		The information system separates user functionality (including user interface services) from information system management functionality.	Information system management functionality includes, for example, functions necessary to administer databases, network components, workstations, or servers, and typically requires privileged user access. The separation of user functionality from information system management functionality is either physical or logical. Organizations implement separation dysystem management-related functionality from user functionality by using different ecomputers, different extrail processing units, different instances of operating systems, different news addresses, virtualization techniques, or combinations of these or other methods, as appropriate. This type of separation includes, for example, web administrative interfaces that use separate authentication methods for users of any other information system resources. Separation of system and user functionality may include isolating administrative interfaces and different domains and with additional access controls.	SA-4,SA-8,SC-3	P1		X	х	
SC-2 (1)		System and Communications Protection Application Partitioning Interfaces for Non- Privileged Users		The information system prevents the presentation of information system management-related functionality at an interface for non-privileged users.	privileges) are not available to general users (including prohibiting the use of the grey-out option commonly used to eliminate accessibility to such information). Such restrictions include, for example, not presenting administration options until users establish sessions with administrator privileges.	AC-3					
SC-3	1	System and Communications Protection Security Function Isolation		The information system isolates security functions from nonsecurity functions.		AC-3,AC-6,SA-4,SA- 5,SA-8,SA-13,SC-2,SC- 7,SC-39				х	
SC-3 (1)	2	System and Communications Protection Security Function Isolation Hardware Separation		The information system utilizes underlying hardware separation mechanisms to implement security function isolation.	Underlying hardware separation mechanisms include, for example, hardware ring architectures, commonly implemented within microprocessors, and hardware-enforced address segmentation used to support logically distinct storage objects with separate attributes (i.e., readable, writeable).						
SC-3 (2)		System and Communications Protection Security Function Isolation Access / Flow Control Functions		The information system isolates security functions enforcing access and information flow control from nonsecurity functions and from other security functions.	Security function isolation occurs as a result of implementation; the functions can still be scanned and monitored. Security functions that are potentially isolated from access and flow control enforcement functions include, for example, auditing, intrusion detection, and anti-virus functions.						
SC-3 (3)	2	System and Communications Protection Security Function Isolation Minimize Nonsecurity Functionality		The organization minimizes the number of nonsecurity functions included within the isolation boundary containing security functions.	In those instances where it is not feosible to achieve strict isolation of nonsecurity functions for mosecurity functions from security functions are firm secretary to take actions to minimize the nonsecurity-relevant functions within the security function boundary. Nonsecurity functions contained within the solation boundary are considered security-relevant because errors or maliciousness in such software, by virtue of being within the boundary, can impact the security functions of organizational information systems. The design objective is that the specific portions of information in security are of minimal size/complexty. Minimizing the number of nonsecurity functions in the security-relevant components of information systems allows designers and implementers to focus only on those functions which are necessary to provide the desired security capability (typically access enforcement.) By minimizing nonsecurity functions within the isolation boundaries, the amount of code that must be trusted to enforce security policies is reduced, thus contributing to understandability.						
SC-3 (4)	2	System and Communications Protection Security Function Isolation Module Coupling and Cohesiveness		The organization implements security functions as largely independent modules that maximize internal cohesiveness within modules and minimize coupling between modules.	The reduction in inter-module interactions helps to constrain security functions and to manage complexity. The concepts of coupling and cohesion are important with respect to modularity in software design. Coupling refers to the dependencies that one module has on other modules. Cohesion refers to the relationship between the different functions within a particular module. Good software engineering practices rely on modular decomposition, layering, and minimization to reduce and manage complexity, thus producing software modules that are highly cohesive and loosely coupled.						

SC-3 (5)	evel 2 1	Control Name System and Communications Protection Security	Withdrawn	Control Text The organization implements security functions as a layered structure minimizing interactions	Supplemental Guidance The implementation of layered structures with minimized interactions among security	Related Controls	Priority	Low	Mod	High	Notes

SC-4	1	System and Communications Protection Information in Shared Resources		The information system prevents unauthorized and unintended information transfer via shared system resources.	complexity. This control prevents information, including encrypted representations of information, produced by the actions of prior users/roles (or the actions of processes acting on behalf of prior users/roles) from being available to any current users/roles (or current processes) that obtain access to shared system resources (e.g., registers, main memory, hard disks) after those resources have been released back to information systems. The control of information is shared resources is also commonly referred to as object ruse and residual information protection. This control does not address: (i) information remanence which refers to residual representation of data that has been nominally erased or removed, (ii) covert channels (including storage and/or timing channels) where shared resources are manipulated to violate information flow restrictions; or (iii) components within information systems for which there are only single users/roles.	AC-3,AC-4,MP-6	P1		X	X	
SC-4 (1)	2	System and Communications Protection Information in Shared Resources Security Levels	X								[Withdrawn: Incorporated into SC-4]
SC-4 (2)	2	System and Communications Protection Information in Shared Resources Periods Processing		The information system prevents unauthorized information transfer via shared resources in accordance with [Assignment: organization-defined procedures] when system processing explicitly switches between different information classification levels or security categories.	This control enhancement applies when there are explicit changes in information processing levels during information system operations, for example, during multilevel processing and periods processing with information at different classification levels or security categories. Organization-defined procedures may include, for example, approved sanitization processes for electronically stored information.						
SC-5	1	System and Communications Protection Denial of Service Protection		The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	A variety of technologies exist to limit, or in some cases, eliminate the effects of denial of service attacks. For example, boundary protection devices can filter certain types of packets to protect information system components on internal organizational networks from being directly affected by denial of service attacks. Employing increased capacity and bandwidth combined with service redundancy may also reduce the susceptibility to denial of service attacks.	SC-6,SC-7	P1	х	x	K	
SC-5 (1)	2	System and Communications Protection Denial of Service Protection Restrict Internal Users		The information system restricts the ability of individuals to launch [Assignment: organization- defined denial of service attacks] against other information systems.	Restricting the ability of individuals to launch denial of service attacks requires that the mechanisms used for such attacks are unavailable, individuals of concern can include, for example, hostile insiders or external adversaries that have successfully breached the information system and are using the system as a platform to launch cyber attacks on third parties. Organizations can restrict the ability of individuals to connect and transmit arbitrary information on the transport medium (i.e., network, wireless spectrum). Organizations can also limit the dolity of individuals to use excessive information system resources. Protection against individuals having the ability to launch denial of service attacks may be implemented on specific information systems or on boundary devices prohibiting egress to potential target systems.						
SC-5 (2)	2	System and Communications Protection Denial of Service Protection Excess Capacity / Bandwidth / Redundancy		The information system manages excess capacity, bandwidth, or other redundancy to limit the effects of information flooding denial of service attacks.	Managing excess capacity ensures that sufficient capacity is available to counter flooding attacks. Managing excess capacity may include, for example, establishing selected usage priorities, quotas, or partitioning.						
SC-5 (3)	2	System and Communications Protection Denial of Service Protection Detection / Monitoring		The organization: (a) Employs [Assignment: organization-defined monitoring tools] to detect indicators of denial of service attacks against the information system; and (b) Monitors [Assignment: organization-defined information system resources] to determine if sufficient resources exist to prevent effective denial of service attacks.	Organizations consider utilization and capacity of information system resources when managing risk from denial of service due to malicious attacks. Denial of service attacks can originate from external or internal sources. Information system resources sensitive to denial of service include, for example, physical disk storage, memory, and CPU cycles. Common safeguards to prevent denial of service attacks related to storage utilization and capacity include, for example, instituting disk quotas, configuring information systems to outomatically alert administrators when specific storage capacity thresholds are reached, using file compression technologies to maximize available storage space, and imposing separate partitions for system and user data.	CA-7,SI-4					
SC-6	1	System and Communications Protection Resource Availability		The information system protects the availability of resources by allocating [Assignment: organization-defined resources] by [Selection (one or more); priority; quota; [Assignment: organization-defined security safeguards]].	Priority protection helps prevent lower-priority processes from delaying or interfering with the information system servicing any higher-priority processes. Quotas prevent users or processes from obtaining more than predetermined amounts of resources. This control does not apply to information system components for which there are only single users/roles.		PO PO				
SC-7	1	System and Communications Protection Boundary Protection		The information system: a. Monitors and controls communications at the external boundary of the system and at key internal boundaries within the system; b. Implements subnetworks for publicly accessible system components that are [Selection: physically; logically] separated from internal organizational networks; and c. Connects to external networks or information systems only through managed interfaces consisting of boundary protection devices arranged in accordance with an organizational security architecture.	based malicious code analysis and virtualization systems, or encrypted tunnels implemented	AC-4,AC-17,CA-3,CM- 7,CP-8,IR-4,RA-3,SC- 5,SC-13	P1	х	x	×	
, ,		System and Communications Protection Boundary Protection Physically Separated Subnetworks	X								[Withdrawn: Incorporated into SC-7]
SC-7 (2)	2	System and Communications Protection Boundary Protection Public Access System and Communications Protection	X	The organization limits the number of external network connections to the information system.	Limitina the number of external network connections facilitates more comprehensive				x 1	ĸ	[Withdrawn: Incorporated into SC-7]
30-7 (3)	-	Boundary Protection Access Points		organization minist are number by external network connections to the injurisation system.	Limiting the number of external network connections Jacilitates more comprenensive monitoring of inbound and outbound communications traffic. The Trusted Internet Connection (TIC) initiative is an example of limiting the number of external network connections.				^

307 (4)	2	system and communications Protection Boundary Protection External Telecommunications Services		The origination. (a) Implements a managed interface for each external telecommunication service; (b) Establishes a traffic flow policy for each managed interface; (b) Establishes a traffic flow policy for each integrity of the information being transmitted across each interface; (d) Documents each exception to the traffic flow policy with a supporting mission/business need and duration of that need; and (e) Reviews exceptions to the traffic flow policy [Assignment: organization-defined frequency] and removes exceptions that are no longer supported by an explicit mission/business need.						_	
SC-7 (5)	2	System and Communications Protection Boundary Protection Deny by Default / Allow by Exception		The information system at managed interfaces denies network communications traffic by default and allows network communications traffic by exception (i.e., deny all, permit by exception).	This control enhancement applies to both inbound and outbound network communications traffic. A deny-all, permit-by-exception network communications traffic policy ensures that only those connections which are essential and approved are allowed.				х	Х	
SC-7 (6)	2	System and Communications Protection Boundary Protection Response to Recognized Failures	Х								[Withdrawn: Incorporated into SC-7 (18)]
SC-7 (7)	2	System and Communications Protection Boundary Practection Prevent Split Tunneling for Remote Devices		The information system, in conjunction with a remate device, prevents the device from simultaneously establishing non-remote connections with the system and communicating via some other connection to resources in external networks.	This control enhancement is implemented within remote devices (e.g., notebook computers) through configuration settings to disoble split tunneling in those devices, and by preventing those configuration settings from being readily configurable by users. This control enhancement is implemented within the information system by the detection of split tunneling (or of configuration settings that allow split tunneling) in the remote device, and by prohibiting the connection if the remote device is using split tunneling. Split tunneling remote users to communicate with local information system resources such as printers/file servers. However, split tunneling would in effect allow unauthorized external connections, making the system more vulnerable to attack and to exfiltration of organizational information. The use of VPNs for remote connections, when adequately provisioned with appropriate security controls, may provide the organization with sufficient assurance that it can effectively treat such connections as non-remote communications paths from remote devices. The use of an adequately provisioned VPN does not eliminate the need for preventing split tunneling.				x	x	
SC-7 (8)	2	System and Communications Protection Boundary Protection Route Traffic to Authenticated Proxy Servers		The information system routes [Assignment: organization-defined internal communications traffic] to [Assignment: organization-defined external networks] through authenticated proxy servers at managed interfaces.	External networks are networks outside of organizational control. A praxy server is a server (i.e., information system or application) that acts as an intermediary for clients requesting information system resources (e.g., files, connections, web pages, or services) from other organizational servers. Client requests established through an initial connection to the proxy server are evaluated to manage complexity and to provide additional protection by limiting direct connectivity. Web content filtering devices are one of the most common proxy servers providing access to the intermet. Proxy servers support logiqui pidividual Transmission Control Protocol (TCP) sessions and blocking specific fullform Resource Locators (URLs), domain names, and Internet Protocol (IP) addresses. Web proxies can be configured with organization-defined lists of authorized and unauthorized websites.	AC-3,AU-2				х	
SC-7 (9)	2	System and Communications Protection		The information system:	Detecting outgoing communications traffic from internal actions that may pose threats to	AU-2 AU-6 SC-38 SC-					
551(0)		Boundary Protection Restrict Threatening Outgoing Communications Traffic		(a) Detects and denies outgoing communications traffic posing a threat to external information systems; and (b) Audits the identity of internal users associated with denied communications.	external information systems is sometimes termed extrusion detection. Extrusion detection at information system boundaries as part of managed interfaces includes the analysis of incoming and outgoing communications traffic searching for indications of internal threats to the security of external systems. Such threats include, for example, traffic indicative of denial of service attacks and traffic containing malicious code.						
SC-7 (10)	2	System and Communications Protection Boundary Protection Prevent Unauthorized Exfiltration		The organization prevents the unauthorized exfiltration of information ocross managed interfaces.	sofeguards implemented by organizations to prevent unauthorized exfiltration of information from information systems include, for example: (i) strict adherence to protocol formats; (ii) monitoring for becoming from information systems; (iii) monitoring for steganography; (iv) disconnecting external network interfaces except when explicitly needed; (v) discossembling and reassembling packet headers; and (vi) employing traffic profile analysis to detect deviations from the volume/types of traffic expected within organizations or coll backs to command and control centers. Devices enforcing strict adherence to protocol formats include, for example, deep packet inspection firewalls and XML gateways. These devices verify adherence to protocol formats and specification at the application layer and serve to identify uhurehabilities that cannot be detected by devices operating at the network or transport layers. This control enhancement is closely associated with cross-domain solutions and system guards enforcing information flow requirements.	SI-3					
SC-7 (11)	2	System and Communications Protection Boundary Protection Restrict Incoming Communications Traffic		The information system only allows incoming communications from [Assignment: organization- defined authorized sources] to be routed to [Assignment: organization-defined authorized destinations].	This control enhancement provides determinations that source and destination address pairs represent authorized/allowed communications. Such determinations can be based on several factors including, for example, the presence of source/destination address pairs in lists of authorized/allowed communications, the obsence of address pairs in lists of unauthorized/disallowed pairs, or meeting more general rules for authorized/allowed source/destination pairs.	AC-3					
SC-7 (12)	2	System and Communications Protection Boundary Protection Host-Based Protection		The organization implements [Assignment: organization-defined host-based boundary protection mechanisms] at [Assignment: organization-defined information system components].	Host-based boundary protection mechanisms include, for example, host-based firewalls. Information system components employing host-based boundary protection mechanisms include, for example, servers, workstations, and mobile devices.						
SC-7 (13)		System and Communications Protection Boundary Protection Isolation of Security Tools / Mechanisms / Support Components		The organization isolates [Assignment: organization-defined information security tools, mechanisms, and support components] from other internal information system components by implementing physically separate subnetworks with managed interfaces to other components of the system.	isolating computer network defenses from critical operational processing networks to prevent adversaries from discovering the analysis and forensics techniques of organizations.	SA-8,SC-2,SC-3					
SC-7 (14)	2	System and Communications Protection Boundary Protection Protects Against Unauthorized Physical Connections		The organization protects against unauthorized physical connections at [Assignment: organization defined managed interfaces].		PE-4,PE-19					
SC-7 (15)	2	System and Communications Protection Boundary Protection Route Privileged Network Accesses		The information system routes all networked, privileged accesses through a dedicated, managed interface for purposes of access control and auditing.		AC-2,AC-3,AU-2,SI-4

SC-15 (3)	2	Inbound / Outbound Communications Traffic System and Communications Protection Collaborative Computing Devices Disabling / Removal in Secure Work Areas		The organization disables or removes collaborative computing devices from [Assignment: organization-defined information systems or information system components] in [Assignment: organization-defined secure work areas].	Failing to disable or remove collaborative computing devices from information systems or information system components can result in subsequent compromises of organizational information including, for example, eavesdropping on conversations.						
SC-15 (4)		System and Communications Protection Collaborative Computing Devices Explicitly Indicate Current Participants		The information system provides an explicit indication of current participants in [Assignment: organization-defined online meetings and teleconferences].	This control enhancement helps to prevent unauthorized individuals from participating in collaborative computing sessions without the explicit knowledge of other participants.						
SC-16	1	System and Communications Protection Transmission of Security Attributes		The information system associates [Assignment: organization-defined security attributes] with information exchanged between information systems and between system components.	Security attributes can be explicitly or implicitly associated with the information contained in organizational information systems or system components.	AC-3,AC-4,AC-16	P0				
SC-16 (1)	2	System and Communications Protection Transmission of Security Attributes Integrity Validation		The information system validates the integrity of transmitted security attributes.	This control enhancement ensures that the verification of the integrity of transmitted information includes security attributes.	AU-10,SC-8					
SC-17	1	System and Communications Protection Public Key Infrastructure Certificates		The organization issues public key certificates under an [Assignment: organization-defined certificate policy] or obtains public key certificates from an approved service provider.	For all certificates, organizations manage information system trust stores to ensure only approved trust anchors are in the trust stores. This control addresses both certificates with visibility external to organizational information systems and certificates related to the internal operations of systems, for example, application-specific time services.	SC-12	P1		x	х	
SC-18		System and Communications Protection Mobile Code		The organization: a. Defines acceptable and unacceptable mobile code and mobile code technologies; b. Stabilishes usage restrictions and implementation guidance for acceptable mobile code and mobile code technologies; and c. Authorizes, monitors, and controls the use of mobile code within the information system.	systems are based on the potential for the code to cause damage to the systems if used maliciously. Mobile code technologies include, for example, Java, JavaScript, ActiveX, Postscript, PDF, Shockwave movies, Flash animations, and VBScript. Usage restrictions and implementation guidance apply to both the selection and use of mobile code installed on servers and mobile code downloaded and executed on individual workstations and devices (e.g., smart phones). Mobile code policy and procedures address preventing the development, acquisition, or introduction of unacceptable mobile code within organizational information systems.	AU-2,AU-12,CM- 2,CM-6,SI-3	P2		х	х	
SC-18 (1)		System and Communications Protection Mobile Code Identify Unacceptable Code / Take Corrective Actions		The information system identifies [Assignment: organization-defined unacceptable mobile code] and takes [Assignment: organization-defined corrective actions].	Corrective actions when unacceptable mobile code is detected include, for example, blocking, quarantine, or alerting administrators. Blocking includes, for example, preventing transmission of word processing files with embedded macros when such macros have been defined to be unacceptable mobile code.						
SC-18 (2)		System and Communications Protection Mobile Code Acquisition / Development / Use		The organization ensures that the acquisition, development, and use of mobile code to be deployed in the information system meets [Assignment: organization-defined mobile code requirements].							
SC-18 (3)	2	System and Communications Protection Mobile Code Prevent Downloading / Execution		The information system prevents the download and execution of [Assignment: organization- defined unacceptable mobile code].							
SC-18 (4)	2	System and Communications Protection Mobile Code Prevent Automatic Execution		The information system prevents the automatic execution of mobile code in [Assignment: organization-defined software applications] and enforces [Assignment: organization-defined actions] prior to executing the code.	Actions enforced before executing mobile code, include, for example, prompting users prior to opening electronic mail attachments. Preventing automatic execution of mobile code includes, for example, disabling outo execute features on information system components employing portable storage devices such as Compact Disks (CDs), Digital Video Disks (DVDs), and Universal Serial Bus (USB) devices.						
SC-18 (5)	2	System and Communications Protection Mobile Code Allow Execution Only in Confined Environments		The organization allows execution of permitted mobile code only in confined virtual machine environments.							
SC-19		System and Communications Protection Voice Over Internet Protocol		The organization: a. Establishes usage restrictions and implementation guidance for Voice over Internet Protocol (VoIP) technologies based on the potential to cause damage to the information system if used maliciously; and b. Authorizes, monitors, and controls the use of VoIP within the information system.			P1		x	х	
SC-20	1	System and Communications Protection Secure Name / Address Resolution Service (Authoritative Source)		The information system: a. Provides additional data origin authentication and integrity verification artifacts along with the authoritative name resolution data the system returns in response to external name/address resolution queries; and b. Provides the means to indicate the security status of child zones and (if the child supports secure resolution services) to enable verification of a chain of trust among parent and child domains, where operating as part of a distributed, hierarchical namespace.	obtain origin authentication and integrity verification assurances for the host/service name to network address resolution information obtained through the service. Information systems that provide name and address resolution services include, for example, domain name system (DNS) servers. Additional artifacts include, for example, DNS Security	AU-10,SC-8,SC-12,SC- 13,SC-21,SC-22	P1)	x	x	х	
SC-20 (1)	2	System and Communications Protection Secure Name / Address Resolution Service (Authoritative Source) Child Subspaces	X								[Withdrawn: Incorporated into SC-20]
SC-20 (2)	2	System and Communications Protection Secure Name Address Resolution Service (Authoritative Source) Data Origin Integrity		The information system provides data origin and integrity protection artifacts for internal name/address resolution queries.							
SC-21	1	System and Communications Protection Secure Name / Address Resolution Service (Recursive or Caching Resolver)		The information system requests and performs data origin authentication and data integrity verification on the name/address resolution responses the system receives from authoritative sources.	Each client of name resolution services either performs this validation on its own, or has authenticated channels to trusted validation providers. Information systems that provide name and address resolution services for local clients include, for example, recursive resolving or caching domain name system (DNS) servers. DNS client resolvers either perform validation of DNSSCE signatures, or clients use authenticated channels to recursive resolvers that perform such validations. Information systems that use technologies other than the DNS to map between host/service names and network addresses provide other means to enable clients to verify the authenticity and integrity of response data.	SC-20,SC-22	P1)	x	х	х	
SC-21 (1)	2	System and Communications Protection Secure Name Address Resolution Service (Recursive or Caching Resolver) Data Origin Integrity	Х								[Withdrawn: Incorporated into SC-21]
	-		•			•					

SC-22	revel	Control Name System and Communications Protection	withdrawn	Control Text The information systems that collectively provide name/address resolution service for an	Supplemental Guidance Information systems that provide name and address resolution services include, for	Related Controls SC-2.SC-20.SC-21.SC-		X X	MOR H	igh	wotes
30-22	1	system and Communications Protection Architecture and Provisioning for Name / Address Resolution Service		organization are fault-tolerant and implement internal/external role separation.	example, domain name system (DNS) servers. To eliminate single points of failure and to enhance redundancy, organizations employ at least two authoritative domain name system servers, one configured as the primary server and the other configured as the secondary server. Additionally, organizations typically deploy the servers in two geographically separated network subnetworks (i.e., not located in the same physical facility). For role separation, DNS servers with internal roles only process name and address resolution requests from within organizations (i.e., from internal clients). DNS servers with external roles only process name and address resolution information requests from clients external to organizations (i.e., on external networks including the Internet). Organizations specify	24	rı ,		^		
SC-23	1	System and Communications Protection Session		The information system protects the authenticity of communications sessions.	clients that can access authoritative DNS servers in particular roles (e.g., by address ranges, explicit lists). This control addresses communications protection at the session, versus packet level (e.g.,	SC-8.SC-10.SC-11	P1	x	. x		
		Authenticity			sessions in service-oriented architectures providing web-based services) and establishes grounds for confidence at both ends of communications sessions in ongoing identities of other parties and in the validity of information transmitted. Authenticity protection includes, for example, protecting against man-in-the-middle attacks/session hijacking and the insertion of false information into sessions.						
SC-23 (1)	2	System and Communications Protection Session Authenticity Invalidate Session Identifiers At Logout		The information system invalidates session identifiers upon user logaut or other session termination.	This control enhancement curtails the ability of adversaries from capturing and continuing to employ previously valid session IDs.						
SC-23 (2)	2	System and Communications Protection Session Authenticity User-Initiated Logouts / Message Displays	X								[Withdrawn: Incorporated into AC-12 (1)]
SC-23 (3)	2	System and Communications Protection Session Authenticity Unique Session Identifiers with Randomization		The information system generates a unique session identifier for each session with fassignment: organization-defined andomness requirements] and recognizes only session identifiers that are system-generated.	This control enhancement curtails the ability of adversaries from reusing previously valid session IDs. Employing the concept of randomness in the generation of unique session identifiers helps to protect against brute-force attacks to determine future session identifiers.	SC-13					
SC-23 (4)	2	System and Communications Protection Session Authenticity Unique Session Identifiers with Randomization	Х								[Withdrawn: Incorporated into SC-23 (3)]
SC-23 (5)	2	System and Communications Protection Session Authenticity Allowed Certificate Authorities		The information system only allows the use of [Assignment: organization-defined certificate authorities] for verification of the establishment of protected sessions.	Reliance on certificate authorities (CAs) for the establishment of secure sessions includes, for example, the use of Secure Socket Loyer (SSL) and/or Transport Loyer Security (TLS) certificates. These certificates, after verification by the respective certificate authorities, facilitate the establishment of protected sessions between web clients and web servers.	SC-13					
SC-24	1	System and Communications Protection Fall in Known State		The information system fails to a [Assignment: organization-defined known-state] for [Assignment: organization-defined types of failures] preserving [Assignment: organization-defined system state information] in failure.		CP-2,CP-10,CP-12,SC- 7,SC-22	P1		х		
SC-25	1	System and Communications Protection Thin Nodes		The organization employs [Assignment: organization-defined information system components] with minimal functionality and information storage.	The deployment of information system components with reduced/minimal functionality (e.g., diskless nodes and thin client technologies) reduces the need to secure every user endpoint, and may reduce the exposure of information, information systems, and services to cyber attacks.	SC-30	PO				
SC-26	1	System and Communications Protection Honeypots		The information system includes components specifically designed to be the target of malicious attacks for the purpose of detecting, deflecting, and analyzing such attacks.	A honeypot is set up as a decoy to attract adversaries and to deflect their attacks away from the operational systems supporting organizational missions/business function. Depending upon the specific usage of the honeypot, consultation with the Office of the General Counsel before deployment may be needed.	SC-30,SC-44,SI-3,SI-4	P0				
SC-26 (1)	2	System and Communications Protection Honeypots Detection of Malicious Code	X								[Withdrawn: Incorporated into SC-35]
SC-27	1	System and Communications Protection Platform-independent Applications		The information system includes: [Assignment: organization-defined platform-independent applications].	platforms are combinations of hardware and software used to run software applications. Platforms include: (i) operating systems; (ii) the underlying computer architectures, or (iii) both. Platform-independent applications are applications that run on multiple platforms. Such applications promote portability and reconstitution on different platforms, increasing the availability of critical functions within organizations while information systems with specific operating systems are under attack.	SC-29	PO				
SC-28		System and Communications Protection Protection of Information At Rest		The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	user information and system information. Information at rest refers to the state of information when it is located not storage devices as specific components of information systems. System-related information requiring protection includes, for example, configurations or rule sets for firewalls, gateways, intrusion detection/prevention systems, filtering routers, and authenticator content. Organizations may employ different mechanisms to achieve confidentiality and integrity protections, including the use cryptographic mechanisms and files have examing, integrity protection can be achieved, for example, by implementing Write-Once-Read-Many (WORM) technologies. Organizations may also employ other security controls including, for example, secure off-line storage in lieu of online storage when adequate protection of information at rest cannot otherwise be achieved and/or continuous monitoring to identify malicious code at rest.	AC-3,AC-6,CA-7,CM- 3,CM-5,CM-6,PE- 3,SC-8,SC-13,SI-3,SI-7	P1	x	X		
		System and Communications Protection Protection of Information At Rest Cryptographic Protection		The information system implements cryptographic mechanisms to prevent unauthorized disclosure and modification of [Assignment: organization-defined information] on [Assignment: organization-defined information system components].	Selection of cryptographic mechanisms is based on the need to protect the confidentiality and integrity of organizational information. The strength of mechanism is commensurate with the security cotegory and/or classification of the information. This control enhancement applies to significant concentrations of digital media in arganizational areas designated for media storage and also to limited quantities of media generally associated with information system components in operational environments (e.g., portable storage devices, mobile devices). Organizations have the flexibility to either encrypt all information on storage devices (i.e., full disk encryption) or encrypt specific data structures (e.g., files, records, or fields). Organizations employing cryptographic mechanisms to protect information at rest also consider cryptographic key management solutions.	AC-19,5C-12					
SC-28 (2)	2	System and Communications Protection Protection of Information At Rest Off-Line Storage		The organization removes from online storage and stores off-line in a secure location [Assignment: organization-defined information].	Removing organizational information from online information system storage to off-line storage eliminates the possibility of individuals gaining unauthorized access to the information through a network. Therefore, organizations may choose to move information to off-line storage in lieu of protecting such information in online storage.						

		Control Name Withdraw	n Control Text	Supplemental Guidance	Related Controls	Priority	Low	Mod	High	Notes
56-29	1	System and Communications Protection Heterogeneity	The organization employs a diverse set of information technologies for [Assignment: organization-defined information system components] in the implementation of the information system.	Increasing the diversity of information technologies within organizational information systems reduces the impact of potential exploitations of specific technologies and also defends against common mode failures, including those failures induced by supply chain attacks. Diversity in information technologies also reduces the likelihood that the means adversaries us to compromise one information system component will be equally effective against other system components, thus further increasing the adversary work factor to successfully complete planned cyber attacks. An increase in diversity may add complexity and management overhead which could ultimately lead to mistakes and unauthorized configurations.	SA-12,SA-14,SC-27	PO	LOW	- Nou	Higil	
SC-29 (1)	2	System and Communications Protection Heterogeneity Virtualization Techniques	The organization employs virtualization techniques to support the deployment of a diversity of operating systems and applications that are changed [Assignment: organization-defined frequency].	While frequent changes to operating systems and applications pose configuration management childneges, the changes can result in an increased work factor for adversaries in order to carry out successful cyber attacks. Changing virtual operating systems or applications, as opposed to changing actual operating systems/applications, provide virtual changes that impede attacker success while reducing configuration management efforts. In addition, virtualization techniques can assist organizations in isolating untrustworthy software and/or software of dubious provenance into confined execution environments.						
GC-30	1	System and Communications Protection Concealment and Misdirection	The organization employs [Assignment: organization-defined concealment and misdirection techniques] for [Assignment: organization-defined information systems] at [Assignment: organization-defined time periods] to confuse and mislead adversaries.	Concealment and misdirection techniques can significantly reduce the targeting capability of adversaries [i.e., window of opportunity) and available attacks surfact to initiate and complete cyber attacks. For example, virtualization techniques provide organizations with the ability to disguise information systems, potentially reducing the likelihood of successful attacks without the cost of having multiple platforms, increased use of concealment/misdirection techniques including, for example, randomness, uncertainty, and virtualization, may sufficiently confuse and mislead adversaries and subsequently increase the risk of discovery and/or exposing tradecraft. Concealment/misdirection techniques may also provide organizations additional time to successfully perform core missions and business functions. Because of the time and effort required to support concealment/misdirection techniques, it is anticipated that such techniques would be used by organizations on a very limited basis.	SC-26,SC-29,SI-14	PO				
SC-30 (1)	2	System and Communications Protection X Concealment and Misdirection Virtualization Techniques								[Withdrawn: Incorporated into SC-29 (1)]
SC-30 (2)	2	IECTINIQUES	The organization employs [Assignment: organization-defined techniques] to introduce randomness into organizational operations and assets.	Randomness introduces increased levels of uncertainty for adversaries regarding the actions organizations take in defending against cyber attacks. Such actions may impede the ability of adversaries to correctly target information resources of organizations supporting critical missions/business functions. Uncertainty may also cause adversaries to hesitate before initiating or continuing attacks. Middirection techniques involving randomness include, for example, performing certain routine actions at different times of day, employing different information technologies (e.g., browers, search engines), using different suppliers, and rotating roles and responsibilities of organizational personnel.						
SC-30 (3)	2	System and Communications Protection Cancelament and Misdirection Change Processing / Storage Locations	The organization changes the location of [Assignment: organization-defined processing and/or storage]. Selection: [Assignment: organization-defined time frequency]; at random time intervals]].	Adversaries target critical organizational missions/business functions and the information resources supporting those missions and functions while at the same time, trying to minimize exposure of their existence and tradecraft. The static, homogeneous, and deterministic nature of organizational information systems targeted by adversaries; make such systems more susceptible to cyber attacks with less adversary cost and effort to be successful. Changing organizational processing and storage locations (sometimes referred to as moving target defense) addresses the advanced persistent threat (APT) using techniques such as virtualization, distributed processing, and replication. This enables organizations to relocate the information resources (i.e., processing and/or storage) supporting critical missions and business functions. Changing locations of processing activities and/or storage alse introduces uncertainty into the targeting activities by adversaries. This uncertainty increases the work factor of adversaries making compromises or breaches to organizational information systems much more difficult and time-consuming, and increases the chances that adversaries may inadvertently disclose aspects of tradecraft while attempting to locate critical organizational resources.						
SC-30 (4)	2	System and Communications Protection Conceolment and Misdirection Misleading Information	The organization employs realistic, but misleading information in [Assignment: organization-defined information system components] with regard to its security state or posture.	This control enhancement misleads potential adversaries regarding the nature and extent of security safleguards deployed by organizations. As a result, adversaries may employ incorrect (and as a result ineffective) attack techniques. One way of misleading adversaries is for arganizations to place misleading information regarding the specific security control deployed in extream information systems that one known to be accessed or targeted by adversaries. Another technique is the use of deception nets (e.g., honeynets, virtualized environments) that minic actual aspects of organizational information systems but use, for example, out-of-date software configurations.						
SC-30 (5)	2	System and Communications Protection Concealment and Misdirection Concealment of System Components	The organization employs [Assignment: organization-defined techniques] to hide or conceal [Assignment: organization-defined information system components].	By hiding, disguising, or otherwise conceeling critical information system components, organizations may be able to decrease the probability that adversaries target and successfully compromise those assets. Potential means for organizations to hide and/or conceal information system components include, for example, configuration of routers or the use of honeynets or virtualization techniques.						
GC-31	1	System and Communications Protection Covert Channel Analysis	The organization: a. Performs a covert channel analysis to identify those aspects of communications within the information system that are potential avenues for covert [Selection (one or more): storage; timing channels; and b. Estimates the maximum bandwidth of those channels.	Developers are in the best position to identify potential areas within systems that might lead to covert channels. Covert channel analysis is a meaningful activity when there is the potential for unauthorized information flows across security domains, for example, in the case of information systems containing export-controlled information and having connections to external networks (i.e., networks not controlled by organizations). Covert channel analysis is also meaningful for multilevel secure (MLS) information systems, multiple security level (MSL) systems, and cross-domain systems.	AC-3,AC-4,PL-2	PO				
SC-31 (1)	2	System and Communications Protection Covert Channel Analysis Test Covert Channels for Exploitability	The organization tests a subset of the identified covert channels to determine which channels are exploitable.							
SC-31 (2)	2	System and Communications Protection Covert Channel Analysis Maximum Bandwidth	The organization reduces the maximum bandwidth for identified covert [Selection (one or more); storage; timing] channels to [Assignment: organization-defined values].	Information system developers are in the best position to reduce the maximum bandwidth for identified covert storage and timing channels.

		Based Protection		system firmware components); and							
				(b) Implements specific procedures for [Assignment: organization-defined authorized individuals]							
				to manually disable hardware write-protect for firmware modifications and re-enable the write-							
				protect prior to returning to operational mode.							
SC-35	1	System and Communications Protection Honeyclients		The information system includes components that proactively seek to identify malicious websites and/or web-based malicious code.	Honeyclients differ from honeypots in that the components actively probe the Internet in search of malicious code (e.g., worms) contained on external websites. As with honeypots,	SC-26,SC-44,SI-3,SI-4	P0				
		noneyclients		and/or web-based malicious code.	honevclients require some supporting isolation measures (e.g., virtualization) to ensure that						
					any malicious code discovered during the search and subsequently executed does not infect						
					organizational information systems.						
SC-36	1	System and Communications Protection Distributed Processing and Storage		The organization distributes [Assignment: organization-defined processing and storage] across multiple physical locations.	Distributing processing and storage across multiple physical locations provides some degree of redundancy or overlap for organizations, and therefore increases the work factor of	CP-6,CP-7	P0				
		Distributed Processing and Storage		multiple physical locations.	adversaries to adversely impact organizations, and therefore increases the work factor of adversaries to adversely impact organizational operations, assets, and individuals. This						
					control does not assume a single primary processing or storage location, and thus allows for						
					parallel processing and storage.						
SC-36 (1)	2	System and Communications Protection		The organization employs polling techniques to identify potential faults, errors, or compromises to		SI-4					
		Distributed Processing and Storage Polling		[Assignment: organization-defined distributed processing and storage components].	adversaries to successfully compromise the confidentiality, integrity, or availability of						
		Techniques			information and information systems. However, distribution of processing and/or storage components does not prevent adversaries from compromising one (or more) of the						
					distributed components. Polling compares the processing results and/or storage content						
					from the various distributed components and subsequently voting on the outcomes. Polling						
					identifies potential faults, errors, or compromises in distributed processing and/or storage						
					components.						
CC 27				The constitution and a factor as a constitution defined as a fibral 1. 126 st.	Out of hand the sould be dead for something the sould be sound by the so	10 2 011 2 011 5 000	20	\vdash			
SC-37	1	System and Communications Protection Out-Of- Band Channels		The organization employs [Assignment: organization-defined out-of-band channels] for the physical delivery or electronic transmission of [Assignment: organization-defined information, information	Out-of-band channels include, for example, local (nonnetwork) accesses to information systems, network paths physically separate from network paths used for operational traffic,	AC-2,CM-3,CM-5,CM-	ru				
		Sund Citalines		system components, or devices] to [Assignment: organization-defined information, information]	or nonelectronic paths such as the US Postal Service. This is in contrast with using the same						
				systems].	channels (i.e., in-band channels) that carry routine operational traffic. Out-of-band channels	, , , . ,					
					do not have the same vulnerability/exposure as in-band channels, and hence the						
					confidentiality, integrity, or availability compromises of in-band channels will not						
					compromise the out-of-band channels. Organizations may employ out-of-band channels in						
					the delivery or transmission of many organizational items including, for example, identifiers/authenticators, configuration management changes for hardware, firmware, or						
					software, cryptographic key management information, security updates, system/data						
					backups, maintenance information, and malicious code protection updates.						
SC-37 (1)	2	System and Communications Protection Out-Of-		The organization employs [Assignment: organization-defined security safeguards] to ensure that	Techniques and/or methods employed by organizations to ensure that only designated						
		Band Channels Ensure Delivery / Transmission		only [Assignment: organization-defined individuals or information systems] receive the [Assignment: organization-defined information, information system components, or devices].	information systems or individuals receive particular information, system components, or devices include, for example, sending authenticators via courier service but requiring						
				[rassignment, organization-aejinea injurnation, information system components, of devices].	recipients to show some form of government-issued photographic identification as a						
					condition of receipt.						
				1	p						

Control ID	Level	Control Name W	Withdrawn	Control Text	Supplemental Guidance	Related Controls	Priority L	au M	lad Hi	ah B	Notes
SC-38	1	System and Communications Protection Operations Security		The organization employs [Assignment: organization-defined operations security safeguards] to protect key organizational information throughout the system development life cycle.	Operations security (OPSEC) is a systematic process by which potential adversaries can be denied information about the capabilities and intentions of organizations by identifying, controlling, and protecting generally unclassified information that specifically relates to the planning and execution of sensitive organizational activities. The OPSEC process involves five steps: (i) identification of critical information (e.g., the security categorization process); (ii) analysis of threats; (iii) analysis of twinearbilities; (iv) assessment of risks; and (v) the application of appropriate countermeasures. OPSEC safeguands are applied to both organizational information systems and the environments in which those systems operate. OPSEC safeguands help to protect the confidentiality of key information including, for example, limiting the sharing of information with suppliers and potential suppliers of information system components, information technology products and services, and with other non-organizational elements and individuals. Information critical to mission/business success includes, for example, user identities, element uses, suppliers, supply chain processes, functional and security requirements, system design specifications, testing protocols, and security control implementation details.	RA-2,RA-5,SA-12	PO				
SC-39		System and Communications Protection Process Isolation		The information system maintains a separate execution domain for each executing process.	Information systems can maintain separate execution domains for each executing process as party assigning each process a separate address space. Each information system process as a distinct address space so that communication between processes is performed in a manner controlled through the security functions, and one process cannot modify the executing processes can be achieved, for example, by implementing separate address spaces. This capability is available in most commercial operating systems that employ multi-state processor technologies.		P1 X	x x	х		
SC-39 (1)	2	System and Communications Protection Process Isolation Hardware Separation		The information system implements underlying hardware separation mechanisms to facilitate process separation.	Hardware-based separation of information system processes is generally less susceptible to compromise than software-based separation, thus providing greater assurance that the separation will be enforced. Underlying hardware separation mechanisms include, for example, hardware memory management.						
SC-39 (2)	2	System and Communications Protection Process		The information system maintains a separate execution domain for each thread in [Assignment:	example, naraware memory management.						
SC-40	1			organization-defined multi-threaded processing]. The information system protects external and internal [Assignment: organization-defined wireless links] from [Assignment: organization-defined types of signal parameter attacks or references to sources for such attacks].	This control applies to internal and external wireless communication links that may be visible to individuals who are not authorized information system users. Adversaries can exploit the signal parameters of wireless links if such links are not adequately protected. There are many ways to exploit the signal parameters of wireless links to gain intelligence, deep service, or to spoof users of organizational information systems. This control reduces the impact of attacks that are unique to wireless systems. If organizations rely on commercial service providers for transmission services as commodify items rather than as fully dedicated services, it may not be possible to implement this control.	AC-18,SC-5	PO				
SC-40 (1)	2	System and Communications Protection Wireless Link Protection Electromagnetic Interference		The Information system implements cryptographic mechanisms that achieve [Assignment: organization-defined level of protection] against the effects of intentional electromagnetic interference.	his control enhancement protects against intentional jamming that might deny or impair communications by ensuring that wireless spread spectrum waveforms used to provide anti-jam protection are not predictable by unauthorized individuals. The control enhancement may also coincidentally help to mitigate the effects of unintentional jamming due to interference form legitimate transmitters sharing the same spectrum. Mission requirements, projected threats, concept of operations, and applicable legislation, differetives, regulations, policies, standards, and quidelines determine levels of wireless link availability and performance/cryptography needed.	SC-12,SC-13					
SC-40 (2)	2	System and Communications Protection Wireless Link Protection Reduce Detection Potential		The information system implements cryptographic mechanisms to reduce the detection potential of wireless links to [Assignment: arganization-defined level of reduction].	This control enhancement is needed for covert communications and protecting wireless transmitters from being geo-located by their transmissions. The control enhancement ensures that spread spectrum waveforms used to achieve low probability of detection are not predictable by unauthorized individuals. Mission requirements, projected threats, concept of operations, and applicable legislation, directives, regulations, policies, standards, and guidelines determine the levels to which wireless links should be undetectable.	SC-12,SC-13					
SC-40 (3)	2	System and Communications Protection Wireless Link Protection Imitative or Manipulative Communications Deception		The information system implements cryptographic mechanisms to identify and reject wireless transmissions that are deliberate attempts to achieve imitative or manipulative communications deception based on signal parameters.	This control enhancement ensures that the signal parameters of wireless transmissions are not predictable by unauthorized individuals. Such unpredictability reduces the probability of limitative or manipulative communications deception based upon signal parameters alone.	SC-12,SC-13					
SC-40 (4)		System and Communications Protection Wireless Link Protection Signal Parameter Identification		The information system implements cryptographic mechanisms to prevent the identification of [Assignment: organization-defined wireless transmitters] by using the transmitter signal parameters.	fingerprint such transmitters for purposes of tracking and mission/user identification. This control enhancement protects against the unique identification of wireless transmitters for purposes of intelligence exploitation by ensuring that anti-fingerprinting alterations to signal parameters are not predictable by unauthorized individuals. This control enhancement helps assure mission success when anonymity is required.	SC-12,SC-13					
SC-41	1	System and Communications Protection Port and I/O Device Access		The organization physically disables or removes [Assignment: organization-defined connection ports or input/output devices] on [Assignment: organization-defined information systems or information system components].	Connection ports include, for example, Universal Serial Bus (USB) and Firewire (IEEE 1394). Input/output (I/O) devices include, for example, Compact Disk (CO) and Digital Video Disk (DVD) drives. Physically disabiling or removing such connection ports and I/O devices helps prevent exfiltration of information from information systems and the introduction of malicious code into systems from those ports/devices.		PO				
SC-42		System and Communications Protection Sensor Capability and Data		The information system: a. Prohibits the remote activation of environmental sensing capabilities with the following exceptions: [Sasignment: organization-defined exceptions where remote activation of sensors is allowed]; and b. Provides an explicit indication of sensor use to [Assignment: organization-defined class of users].	accelerometers. While the sensors on mobiles devices provide an important function, if activated coverfly, such devices can potentially provide a means for adversaries to learn valuable information about individuals and organizations. For example, remotely activating the GPS function on a mobile device could provide an adversary with the ability to track the specific movements of an individual.		PO				
SC-42 (1)	2	System and Communications Protection Sensor Capability and Data Reporting to Authorized Individuals or Roles		The organization ensures that the information system is configured so that data or information collected by the (Assignment: organization-defined sensors) is only reported to authorized individuals or roles.	In situations where sensors are activated by authorized individuals (e.g., end users), it is still possible that the data/information collected by the sensors will be sent to unauthorized entities.						

SC-42 (2)	Level 2	Control Name System and Communications Protection Sensor Capability and Data Authorized Use	Withdrawn	Control Text The organization employs the following measures: [Assignment: organization-defined measures], so that data or information collected by [Assignment: organization-defined sensors] is only used for authorized purposes.	Supplemental Guidance Information Collected by sensors for a specific authorized purpose potentially could be misused for some unauthorized purpose. For example, GPS sensors that are used to support traffic navigation could be misused to track movements of individuols. Measures to mitigate such activities include, for example, additional training to ensure that authorized parties do not abuse their authority, or (in the case where sensor data/information is maintained by external parties) contractual restrictions on the use of the data/information.	Related Controls	Priority	Low	Mod	High	Notes
SC-42 (3)	2	System and Communications Protection Sensor Capability and Data Prohibit Use of Devices		The organization prohibits the use of devices possessing [Assignment: organization-defined environmental sensing capabilities] in [Assignment: organization-defined facilities, areas, or systems].	For example, organizations may prohibit individuals from bringing cell phones or digital cameras into certain facilities or specific controlled areas within facilities where classified information is stored or sensitive conversations are taking place.						
SC-43	1	System and Communications Protection Usage Restrictions		System). The organization: a. Establishes usage restrictions and implementation guidance for [Assignment: organization-defined information system components] based on the potential to cause damage to the information system if used maliciously; and b. Authorizes, monitors, and controls the use of such components within the information system.	Information system components include hardware, software, or firmware components (e.g., Voice Over Internet Protocol, mobile code, digital copiers, printers, scanners, optical devices, wireless technologies, mobile devices).	CM-6,SC-7	PO				
SC-44	1	System and Communications Protection Detonation Chambers		The organization employs a detonation chamber capability within [Assignment: organization-defined information system, system component, or location].	Detonation chambers, also known as dynamic execution environments, allow organizations to open email attachments, execute untrusted or suspicious applications, and execute Universal Resource Locator (URL) requests in the safety of an isolated environment or virtualized sandbox. These protected and isolated execution environments provide a means of determining whether the associated attachment/spiplications contain malicious code. While related to the concept of deception nets, the control is not intended to maintain a long-term environment in which adversaries can operate and their actions can be observed. Rather, it is intended to quickly identify malicious code and reduce the likelihood that the code is propagated to user environments of operation (or prevent such propagation completely).	SC-7,SC-25,SC-26,SC-30	PO				
CE.	0	Security									[Privacy Controls]
SE-1	1	Security Inventory of Personally Identifiable Information		The organization: a. Establishes, maintains, and updates [Assignment: organization-defined frequency] an inventory that contains a listing of all programs and information systems identified as collecting, using, maintaining, or sharing personally identifiable information [III]; and b. Provides each update of the PIII inventory to the IOO or information security official [Assignment: organization-defined frequency] to support the establishment of information security requirement for all new or modified information systems containing PII.	and physical security policies and procedures to protect PII consistent with Appendix F, and to mitigate risks of PII exposure. As one method of gathering information for their PII inventories, organizations may extract the following information elements from Privacy Impact Assessments (PIA) for information systems containing PII: (1) the name and acronym	AR-1, AR-4, AR-5, AT- 1, DM-1, PM-5					[Privacy Controls]
SE-2	1	Security Privacy Incident Response		The organization: a. Develops and implements a Privacy incident Response Plan; and b. Provides an organized and effective response to privacy incidents in accordance with the organizational Privacy incident Response Plan.	In contrast to the Incident Response (IRI) family in Appendix F, which concerns a broader range of incidents affecting information security, this control uses the term Privacy incident to describe only those incidents that relate to personally identifiable information (IRI). The organization Privacy incident Response Plan is developed under the leadership of the SAOP/CPO. The plan includes: (I) the establishment of a cross-functional Privacy Incident Response Plan; (III) a process to determine whether notice to oversight organizations or affected individuals is appropriate and to provide that notice accordingly; (III) a privacy risk sessement process to determine the extent of harm, embarrassment, inconvenience, or unfairness to affected individuals and, where appropriate, to take steps to mitigate any such risks; (IVI) internal procedures to ensure prompt reporting by employees and contractors of any privacy incident to information security officials and the Senior Agency Official for Privacy (SAOP)/Chief Privacy Officer (CPO), consistent with organizational incident management structures, and (I) internal procedures for reporting noncompliance with organizational privacy policy by employees or contractors or appropriate management or oversight officials. Some organizations may be required by law or policy to provide notice to oversight organizations in the event of a breach. Organizations may also choose to integrate Privacy Incident Response Plans with Security Incident Response Plans, or keep the plans separate.	ARL, AR-G, AR-G, AR-G, AU-1 through 14. 		Protection Testing / Verification		(a) Tests malicious code protection mechanisms [Assignment: organization-defined frequency] by introducing a known benign, non-spreading test case into the information system; and (b) Verifies that both detection of the test case and associated incident reporting occur.							
SI-3 (7)		System and Information Integrity Malicious Code Protection Nonsignature-Based Detection		The information system implements nonsignature-based malicious code detection mechanisms.	Nonsignature-based detection mechanisms include, for example, the use of heuristics to detect, analyze, and describe the characteristics or behavior of malicious code and to provide safeguards against malicious code for which signatures do not yet exist or for which existing signatures may not be effective. This includes polymarphic malicious code (i.e., code that changes signatures when it replicates). This control enhancement does not preclude the use of signature-based detection mechanisms.						
SI-3 (8)	2	System and Information Integrity Malicious Code Protection Detect Unauthorized Commands		The information system detects [Assignment: organization-defined unauthorized operating system commands) through the kernel application programming interface at [Assignment: organization-defined information system hardware components] and [Selection (one or more): issues a warning; audits the command execution; prevents the execution of the command].	This control enhancement can also be applied to critical interfaces other than kernel-based interfaces, including for example, interfaces with virtual machines and privileged applications. Unauthorized operating system commands include, for example, commands for kernel functions from information system processes that are not trusted to initiate such commands, or commands for kernel functions that are suspicious even though commands of that type are reasonable for processes to initiate. Organizations can define the malicious commands to be detected by a combination of command types, command classes, or specific instances of commands. Organizations can define hardware components by specific component, component type, location in the network, or combination therein. Organizations may select different actions for different types/classes/specific instances of potentially malicious commands.						
SI-3 (9)	2	System and Information Integrity Molicious Code Protection Authenticate Remote Commands		The information system implements [Assignment: organization-defined security safeguards] to authenticate [Assignment: organization-defined remote commands].	This control enhancement protects against unauthorized commands and replay of authorized commands. This capability is important for those remote information systems whose loss, mighurction, misdirection, or exploitation would have immediate and/or serious consequences (e.g., injury or death, property damage, loss of high-valued assets or sensitive information, or failure of important missions/business functions). Authentication sofeguards for remote commands help to ensure that information systems accept and execute in the order intended, only authorized commands, and that unauthorized commands are rejected. Cryptographic mechanisms can be employed, for example, to authenticate remote commands.	SC-12,SC-13,SC-23					
SI-3 (10)	2	System and Information Integrity Malicious Code Protection Malicious Code Analysis		The organization: (a) Employs [Assignment: organization-defined tools and techniques] to analyze the characteristics and behavior of molicious code; and (b) Incorporates the results from malicious code analysis into organizational incident response and flow remediation processes.	The application of selected malicious code analysis tools and techniques provides organizations with a more in-depth understanding of adversary tradecraft (i.e., tactics, techniques, and procedures) and the functionality and purpose of specific instances of malicious code. Understanding the characteristics of malicious code facilitates more effective organizational responses to current and future threats. Organizations can conduct malicious code analyses by using reverse engineering techniques or by monitoring the behavior of executing code.						
SI-4	1	System and Information Integrity Information System Monitoring		The organization: a. Monitors the information system to detect: a. 1. Attacks and indicators of potential attacks in accordance with [Assignment: organization-defined monitoring objectives], and consider the monitoring objectives], and consider the monitoring objectives], and remote connections; b. Identifies unauthorized use of the information system through [Assignment: organization-defined techniques and methods]; c. Deploys monitoring devices: c. 1. Strategically within the information system to collect organization-determined essential information; and c. 2. At ad hoc locations within the system to track specific types of transactions of interest to the organization; d. Protects information obtained from intrusion-monitoring tools from unauthorized access, modification, and deletion; e. Heightens the level of information system monitoring activity whenever there is an indication of increased risk to organizational operations and assets, individuals, other organizations, or the Nation based on law enforcement information, intelligence information, or other credible sources of information; f. Obtain legal opinion with regard to information system monitoring information] to Rasignment: organization-defined information system monitoring information] to Rasignment: organization-defined personnel or roles] [Selection (one or more): as needed; [Assignment: organization-defined frequency]].	Information system monitoring includes external and internal monitoring. External monitoring includes the observation of events occurring at the information system boundary (i.e., part of perimeter defense and boundary protection). Internal monitoring includes the observation of events occurring within the information system. Organizations can monitoring information systems, for example, by observing audit activities in real time or by observing other system aspects such as access patterns, characteristics of access, and other actions. The monitoring objectives may guide determination of the events. Information system monitoring capability is achieved through a variety of tools and techniques (e.g., intrusion detection systems, intrusion prevention systems, malicious code protection software, scanning tools, audit record monitoring goftware, network monitoring software). Strategic locations for monitoring devices include, for example, selected perimeter locations and exercise for a supporting critical applications, with such devices typically being employed at the managed interfaces associated with controls SC-7 and AC-17. Einstein network monitoring devices from the Department of Homeland Security can also be included as monitoring devices. The granularity of monitoring information collected is based on organizational monitoring objectives and the capability of information systems to support such objectives. Specific types of transactions of interest include, for example, Hyper Text Transfer Protocol (HTTP) traffic text bypasses HTTP proxies. Information systems monitoring as an integral part of organizational acontinuous monitoring and incident response programs. A network connection is any connection with a device that communicates through an etwork (e.g., local area network internet). Local, network, and remote connections can be either wired or wireless.	7,AU-9,AU-12,Ca- 7,IR-4,PE-3,RA-5,SC- 7,SC-26,SC-35,SI-3,SI- 7	P1	x	x	x	
SI-4 (1)	2	System and Information Integrity Information System Monitoring System-Wide Intrusion Detection System		The organization connects and configures individual intrusion detection tools into an information system-wide intrusion detection system.							
SI-4 (2)	2	System and Information Integrity Information System Monitoring Automated Tools for Real- Time Analysis		The organization employs automated tools to support near real-time analysis of events.	Automated tools include, for example, host-based, network-based, transport-based, or storage-based event monitoring tools or Security Information and Event Management (SIEM) technologies that provide real time analysis of alerts and/or notifications generated by organizational information systems.				х	х	
SI-4 (3)		System and Information Integrity Information System Monitoring Automated Tool Integration		The organization employs automated tools to integrate intrusion detection tools into access control and flow control mechanisms for rapid response to attacks by enabling reconfiguration of these mechanisms in support of attack isolation and elimination.							
SI-4 (4)	2	System and Information Integrity Information System Monitoring Inbound and Outbound Communications Traffic		The information system monitors inbound and outbound communications traffic (Assignment: organization-defined frequency) for unusual or unauthorized activities or conditions.	Unusua/unauthorized activities or conditions related to information system inbound and outbound communications traffic include, for example, internal traffic that indicates the presence of malicious code within organizational information systems or propagating among system components, the unauthorized exporting of information, or signaling to external information systems. Evidence of malicious code is used to identify potentially compromised information systems or information system components.				X	X	
SI-4 (5)	2	System and Information Integrity Information System Monitoring System-Generated Alerts		The information system alerts [Assignment: organization-defined personnel or roles] when the following indications of compromise or potential compromise occur: [Assignment: organization-defined compromise indicators].	Alerts may be generated from a variety of sources, including, for example, audit records or inputs from malicious code protection mechanisms, intrusion detection or prevention mechanisms, boundary protection devices such si frewalls, gateways, and routers. Alerts can be transmitted, for example, telephonically, by electronic mail messages, or by text messaging. Organizational personnel on the notification list can include, for example, system administrators, mission/business owners, system owners, or information system security offices.	AU-5,PE-6			х	х	
SI-4 (6)	2	System and Information Integrity Information System Monitoring Restrict Non-Privileged Users	X								[Withdrawn: Incorporated into AC-6 (10)]

Control ID	Level	Control Name Withdrawn	Control Tout	Supplemental Guidance	Related Controls	Deiovite	Laur Mad	Ulah	Notes
SI-4 (7)	Level 2	Control Name Withdrawn System and Information Integrity Information System Monitoring Automated Response to Suspicious Events	Control Text The information system notifies [Assignment: organization-defined incident response personnel (identified by name and/or by role)] of detected suspicious events and takes [Assignment: organization-defined least-disruptive actions to terminate suspicious events].	Supplemental Gulorite Least-disruptive actions may include, for example, initiating requests for human responses.	Related Controls	Priority	Low Mod	High	Notes
SI-4 (8)	2	System and Information Integrity Information X System Monitoring Protection of Monitoring							[Withdrawn: Incorporated into SI-4]
SI-4 (9)	2	Information System and Information Integrity Information System Monitoring Testing of Monitoring Tools	The organization tests intrusion-monitoring tools [Assignment: organization-defined frequency].	Testing intrusion-monitoring tools is necessary to ensure that the tools are operating correctly and continue to meet the monitoring objectives of organizations. The frequency of testing depends on the types of tools used by organizations and methods of deployment.	CP-9				
SI-4 (10)	2	System and information integrity information System Monitoring Visibility of Encrypted Communications	The organization makes provisions so that [Assignment: organization-defined encrypted communications traffic] is visible to [Assignment: organization-defined information system monitoring tools].	Organizations balance the potentially conflicting needs for encrypting communications traffic and for having insight into such traffic and for having insight into such traffic from a monitoring perspective. For some organizations, the need to ensure the confidentiality of communications traffic is paramount; for others, mission-assurance is of greater concern. Organizations determine whether the visibility requirement applies to internal encrypted traffic, encrypted traffic intended for external destinations, or a subset of the traffic types.					
SI-4 (11)	2	System and Information Integrity Information System Monitoring Analyze Communications Traffic Anomalies	The organization analyzes outbound communications traffic at the external boundary of the information system and selected [Assignment: organization-defined interior points within the system (e.g., subnetworks, subsystems)] to discover anomalies.	Anomalies within organizational information systems include, for example, large file transfers, long-time persistent connections, unusual protocols and ports in use, and attempted communications with suspected malicious external addresses.					
SI-4 (12)	2	System and Information Integrity Information System Monitoring Automated Alerts	The organization employs automated mechanisms to alert security personnel of the following inappropriate or unusual activities with security implications: [Assignment: organization-defined activities that trigger alerts].	This control enhancement focuses on the security alerts generated by organizations and transmitted using automated means. In contrast to the alerts generated by information systems in St-4 (5), which tend to focus on information sources internal to the systems (e.g., audit records), the sources of information for this enhancement can include other entities as well (e.g., suspicious activity reports, reports on potential insider threats).	AC-18,IA-3				
SI-4 (13)	2	System and Information Integrity Information System Monitoring Analyze Traffic / Event Patterns	The organization: (a) Analyzes communications traffic/event patterns for the information system; (b) Develops profiles representing common traffic patterns and/or events; and (c) Uses the traffic/event profiles in tuning system-monitoring devices to reduce the number of false positives and the number of false negatives.						
SI-4 (14)	2	System and Information Integrity Information System Monitoring Wireless Intrusion Detection	The organization employs a wireless intrusion detection system to identify roque wireless devices and to detect attack attempts and potential compromises/breaches to the information system.	Wireless signals may radiate beyond the confines of organization-controlled facilities. Organizations proactively search for unauthorized wireless connections including the conduct of thorough scans for unauthorized wireless access points. Scans are not limited to those areas within facilities containing information systems, but also include areas outside of facilities as needed, to verify that unauthorized wireless access points are not connected to the systems.	AC-18,IA-3				
SI-4 (15)	2	System and Information Integrity Information System Monitoring Wireless to Wireline Communications	The organization employs an intrusion detection system to monitor wireless communications traffic as the traffic passes from wireless to wireline networks.		AC-18				
SI-4 (16)	2	Communications System and Information Integrity Information System Monitoring Correlate Monitoring Information	The organization correlates information from monitoring tools employed throughout the information system.	Correlating information from different monitoring tools can provide a more comprehensive view of information system activity. The correlation of monitoring tools that usually work in isolation (e.g.) nost monitoring, network monitoring, anti-virus software) can provide an arganization-wide view and in so doing, may reveal otherwise unseen attack patterns. Understanding the capabilities/limitations of diverse monitoring tools and how to maximize the utility of information generated by those tools can help organizations to build, operate, and maintain effective monitoring programs.					
SI-4 (17)	2	System and Information Integrity Information System Monitoring Integrated Situational Awareness	The organization correlates information from monitoring physical, cyber, and supply chain activities to achieve integrated, organization-wide situational awareness.	This control enhancement correlates monitoring information from a more diverse set of information sources to achieve integrated situational awareness. Integrated situational awareness integrated situational awareness from a combination of physical, cyber, and supply chain monitoring activities enhances the capability of organizations to more quickly detect sophisticated cyber attacks and investigate the methods and techniques employed to carry out such attacks. In contrast to 5-4 (16) which correlates the various cyber monitoring information, this control enhancement correlates monitoring beyond just the cyber domain. Such monitoring may help reveal attacks on organizations that are operating across multiple attack vectors.	SA-12				
SI-4 (18)	2	System and Information Integrity Information System Manitoring Analyze Traffic / Covert Exfiltration	The organization analyzes outbound communications traffic at the external boundary of the information system (i.e., system perimeter) and at [Assignment: organization-defined interior points within the system (e.g., subsystems, subnetworks)] to detect covert exfiltration of information.	Covert means that can be used for the unauthorized exfiltration of organizational information include, for example, steganography.					
SI-4 (19)	2	System and information Integrity Information System Monitoring Individuals Posing Greater Risk	The organization implements [Assignment: organization-defined additional monitoring] of individuals who have been identified by [Assignment: organization-defined sources] as posing an increased level of risk.	Indications of increased risk from individuals can be obtained from a variety of sources including, for example, human resource records, intelligence agencies, tow enforcement organizations, and/or other credible sources. The monitoring of individuals is closely coordinated with management, legal, security, and human resources officials within arganizations conducting such monitoring and complies with federal legislation, Executive Orders, policies, directives, regulations, and standards.					
SI-4 (20)	2	System and Information Integrity Information System Monitoring Privileged Users	The organization implements [Assignment: organization-defined additional monitoring] of privileged users.						
SI-4 (21)	2	System and Information Integrity Information System Monitoring Probationary Periods	The organization implements [Assignment: organization-defined additional monitoring] of individuals during [Assignment: organization-defined probationary period].						
SI-4 (22)	2	System and Information Integrity Information System Monitoring Unauthorized Network Services	The information system detects network services that have not been authorized or approved by [Assignment: organization-defined authorization or approval processes] and [Selection (one or more): audits; olerts [Assignment: organization-defined personnel or roles]].	Unauthorized or unapproved network services include, for example, services in service- oriented architectures that lack organizational verification or validation and therefore may be unreliable or serve as malicious rogues for valid services.	AC-6,CM-7,SA-5,SA-9				
SI-4 (23)	2	System and Information Integrity Information System Monitoring Host-Based Devices	The organization implements [Assignment: organization-defined host-based monitoring mechanisms] at [Assignment: organization-defined information system components].	Information system components where host-based monitoring can be implemented include, for example, servers, workstations, and mobile devices. Organizations consider employing host-based monitoring mechanisms from multiple information technology product developers.					
SI-4 (24)	2	System and information Integrity Information System Monitoring Indicators of Compromise	The information system discovers, collects, distributes, and uses indicators of compromise.	Indicators of compromise (IOC) are forensic artifacts from intrusions that are identified on arganizational information systems (at the host or network level). IOCs provide organizations with valuable information on objects or information systems that have been compromised. IOCs for the discovery of compromised hosts can include for example, the receivation of registry key values. IOCs for network traffic include, for example, Universal Resource Locator (IJRL) or protocol elements that indicate malware command and control servers. The rapid distribution and adoption of IOCs can improve information security by reducing the time that information systems and arganizations are vulnerable to the same exploit or attack.					

							_				
Control ID	Level	Control Name	Withdrawn	Control Text	Supplemental Guidance	Related Controls	Priority	Low	Wiod	eligh v	Notes
SI-5	1	System and Information Integrity Security Alerts, Advisories, and Directives		The organization: a. Receives information system security alerts, advisories, and directives from [Assignment: organization-defined external organizations] on an ongoing basis; b. Generates internal security alerts, advisories, and directives as deemed necessary; c. Disseminates security alerts, advisories, and directives to: [Selection (one or more): [Assignment: organization-defined elements within the organization-defined external organizations]; and d. Implements security directives in accordance with established time frames, or notifies the issuing organization of the degree of noncompliance.	The United States Computer Emergency Readiness Feam (US-CERT) generates security alerts and advisories to maintain situational awareness across the federal government. Security directives are issued by OMB or other designated organizations with the responsibility and authority to issue such directives. Compliance to security directive is essential due to the critical nature of many of these directives and the potential immediate adverse effects on organizational operations and assets, individuals, other organizations, and the Nation should the directives not be implemented in a timely manner. External organizations include, for example, external mission/business partners, supply chain partners, external service providers, and other peer/supporting organizations.	SI-2	P1	X	x	x	
SI-5 (1)	2	System and Information Integrity Security Alerts, Advisories, and Directives Automated Alerts and Advisories		The organization employs automated mechanisms to make security alert and advisory information available throughout the organization.	The significant number of changes to arganizational information systems and the environments in which those systems operate requires the dissemination of security- related information to a variety of arganizational entities that have a direct interest in the success of organizational missions and business functions. Based on the information provided by the security alerts and advisories, shanges may be required at one or more of the three tiers related to the management of information security risk including the governance level, mission/business process/enterprise architecture level, and the information system level.					X	
SI-6	1	System and Information Integrity Security Function Verification		The information system: a. Verifies the correct operation of [Assignment: organization-defined security functions]; b. Performs this verification [Selection (one or more): [Assignment: organization-defined system transitional states], upon command by user with appropriate privilege; [Assignment: organization-defined frequency]); c. Notifies [Assignment: organization-defined personnel or roles] of failed security verification tests and d. [Selection (one or more): shuts the information system down; restarts the information system; [Assignment: organization-defined alternative action(s)]] when anomalies are discovered.	Transitional states for information systems include, for example, system startup, restart, shutdown, and abort. Notifications provided by information systems include, for example, electronic alerts to system administrators, messages to local computer consoles, and/or hardware indications such as lights.	CA-7,CM-6	P1			х	
SI-6 (1)	2	System and Information Integrity Security Function Verification Notification of Failed Security Tests	Х								[Withdrawn: Incorporated into SI-6]
SI-6 (2)		System and Information Integrity Security Function Verification Automation Support for Distributed Testing		The information system implements automated mechanisms to support the management of distributed security testing.		SI-2					
SI-6 (3)		System and Information Integrity Security Function Verification Report Verification Results		The organization reports the results of security function verification to [Assignment: organization-defined personnel or roles].	include, for example, senior information security officers, information system security managers, and information systems security officers.	SA-12,SI-4,SI-5					
SI-7	1	System and Information Integrity Software, Firmware, and Information Integrity		The organization employs integrity verification tools to detect unauthorized changes to [Assignment: organization-defined software, firmware, and information].	Unauthorized changes to software, firmware, and information can occur due to errors or malicious activity (e.g., tampering). Software includes, for example, operating systems (with key internal components such as kernels, drivers), middleware, and applications. Firmware includes, for example, the Basic Input Output System (BIOS). Information includes metadata such as security attributes associated with information. State-of-the-practice integrity-checking mechanisms (e.g., parity checks, cyclical redundancy checks, cryptographic hashes) and associated tools can automatically monitor the integrity of information systems and hosted applications.	SA-12,SC-8,SC-13,SI-3	P1		x	x	
SI-7 (1)	2	System and Information Integrity Software, Firmware, and Information Integrity Integrity Checks		The information system performs on integrity check of [Assignment: organization-defined software, firmware, and information] [Selection (one or more): at startup; at [Assignment: organization-defined transitional states or security-relevant events]; [Assignment: organization-defined frequency]].	Security-relevant events include, for example, the identification of a new threat to which organizational information systems are susceptible, and the installation of new hardware, software, or firmware. Transitional states include, for example, system startup, restart, shutdown, and abort.				х	х	
SI-7 (2)	2	System and Information Integrity Software, Firmware, and Information Integrity Automated Notifications of Integrity Violations		The organization employs automated tools that provide notification to [Assignment: organization-defined personnel or roles] upon discovering discrepancies during integrity verification.	The use of automated tools to report integrity violations and to notify organizational personnel in a timely matter is an essential precursor to effective risk response. Personnel having an interest in integrity violations include, for example, mission/business owners, information system owners, systems administrators, software developers, systems integrators, and information security officers.					х	
SI-7 (3)	2	System and Information Integrity Software, Firmware, and Information Integrity Centrally- Managed Integrity Tools		The organization emplays centrally managed integrity verification tools.		AU-3,5I-2,5I-8					
SI-7 (4)	2	System and Information Integrity Software, Firmware, and Information Integrity Tamper- Evident Packaging	Х								[Withdrawn: Incorporated into SA-12]
SI-7 (5)	2	System and Information Integrity Software, Firmware, and Information Integrity Automated Response to Integrity Violations		The information system automatically [Selection (one or more): shuts the information system down; restarts the information system; implements [Assignment: organization-defined security safeguards]] when integrity violations are discovered.	Organizations may define different integrity checking and anomaly responses: (I) by type of information (e.g., firmware, software, user data); (ii) by specific information (e.g., both firmware, both firmware for a specific types of machines); or (iii) a combination of both. Automatic implementation of specific sofgeaurds within organizational information systems includes, for example, reversing the changes, holting the information system, or triggering audit alerts when unauthorized modifications to critical security files occur.					х	
SI-7 (6)	2	System and Information Integrity Software, Firmware, and Information Integrity Cryptographic Protection		The information system implements cryptographic mechanisms to detect unauthorized changes to software, firmware, and information.	Cryptographic mechanisms used for the protection of integrity include, for example, digital signatures and the computation and application of signed hashes using asymmetric cryptography, protecting the confidentiality of the key used to generate the hash, and using the public key to verify the hash information.	SC-13					
SI-7 (7)		System and Information Integrity Software, Firmware, and Information Integrity Integration of Detection and Response		The organization incorporates the detection of unauthorized [Assignment: organization-defined security-relevant changes to the information system] into the organizational incident response copability.	corrected, and available for historical purposes. Maintaining historical records is important both for being able to identify and discern adversary actions over an extended period of time and for possible legal actions. Security-relevant changes include, for example, unauthorized changes to established configuration settings or unauthorized elevation of information system privileges.	IR-4,IR-5,SI-4			х	х	
SI-7 (8)	2	System and Information Integrity Software, Firmware, and Information Integrity Auditing Capability for Significant Events		The information system, upon detection of a potential integrity violation, provides the capability to audit the event and initiates the following actions: [Selection (one or more): generates an audit record; olerts current user; olerts [Assignment: organization-defined personnel or roles]; [Assignment: organization-defined other actions]].		AU-2,AU-6,AU-12					
SI-7 (9)	2	System and Information Integrity Software, Firmware, and Information Integrity Verify Boot Process		The information system verifies the integrity of the boot process of [Assignment: organization-defined devices].	Ensuring the integrity of boot processes is critical to starting devices in known/trustworthy states. Integrity verification mechanisms provide organizational personnel with assurance that only trusted code is executed during boot processes.

The information system: (a) Provides a manual override capability for input validation of [Assignment: organization-defined inputs]; (B) Restricts the use of the manual override capability to only [Assignment: organization-defined authorized individuals]; and (c) Audits the use of the manual override capability. The organization ensures that input validation errors are reviewed and resolved within [Assignment: organization-defined time period]: The information system behaves in a predictable and documented manner that reflects organizational and system objectives when invalid inputs are received. The organization accounts for timing interactions among information system components in	length, numerical range, and acceptable values) verifies that inputs match specified definitions for format and contents. Onforwar applications typically follow well-defined protocols that use structured messages (i.e., commands or queries) to communicate between software modules or system components. Structured messages can contain raw or unstructured data interspersed with metadata or control information. If software applications use attacker-supplied inputs to construct structured messages can contain raw or unstructured data interspersed with metadata or control information. If software applications uses attacker-supplied inputs to construct structured messages without properly encoding such messages, then the attacker could insert malicious commands or special characters that can cause the data to be interpreted as control information or metadata. Consequently, the module or component that receives the tained output will perform the wrong operations or otherwise interpret the data incorrectly. Prescreening inputs prior to passing to interpreters prevents the content from being unintentionally interpreted as commands. Input validation helps to ensure accurate and correct inputs and prevent attacks such as cross-site scripting and a variety of injection attacks. **Resolution of input validation errors includes, for example, correcting systemic causes of errors and resubmitting transactions with corrected input. **Acommon vulnerability in organizational information systems is unpredictable behavior when involid inputs are received. This control enhancement ensures that there is predictable behavior in the face of involid inputs by specifying information system esponses that focilitate transitioning the system to known states without adverse, unintended side effects. **In addressing invalid information system inputs received across protocol interfaces, timing interactions become relevant, where one protocol needs to consider the impact of the error response on other protocols within the protocol stack. SI-10 (5)	2	System and Information Integrity Information Input Validation Restrict Inputs to Trusted Sources and Approved Formats	- Malalawii	The organization restricts the use of information inputs to [Assignment: organization-defined trusted sources] and/or [Assignment: organization-defined formats].	This control enhancement applies the concept of whitelisting to information inputs. Specifying known trusted sources for information inputs and acceptable formats for such inputs can reduce the probability of malicious activity.	neated controls	Honey	100 IVIO	rngn	No.5
SI-11	1	System and Information Integrity Error Handling		The information system: a. Generates error messages that provide information necessary for corrective actions without revealing information that could be exploited by adversaries; and b. Reveals error messages only to [Assignment: organization-defined personnel or roles].	Organizations carefully consider the structure/content of error messages. The extent to which information systems are able to identify and handle error conditions is guided by organizational policy and operational requirements. Information that could be exploited by adversaries includes, for example, erroneous logon attempts with passwords entered by mistake as the username, mission/business information that can be derived from (if not stated explicitly by) information recorded, and personal information such as account numbers, social security numbers, and credit card numbers. In addition, error messages may provide a covert channel for transmitting information.	AU-2,AU-3,SC-31	P2	x	х	
SI-12	1	System and Information Integrity Information Handling and Retention		The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	Information handling and retention requirements cover the full life cycle of information, in some cases extending beyond the disposal of information systems. The National Archives and Records Administration provides guidance on records retention.	AC-16,AU-5,AU- 11,MP-2,MP-4	P2	x	x	
SI-13	1	System and Information Integrity Predictable Failure Prevention		The organization: a. Determines mean time to failure (MTTF) for [Assignment: organization-defined information system components] in specific environments of operation; and b. Provides substitute information system components and a means to exchange active and standby components at [Assignment: organization-defined MTTF substitution criteria].	While MTTF is primarily a reliability issue, this control addresses potential failures of specific information system components that provide security capability. Failure rates reflect installation-specific consideration, not industry-average. Organizations define criteria for substitution of information system components based on MTTF value with consideration for resulting potential harm from component failures. Transfer of responsibilities between active and standby components does not compromise safety, operational readiness, or security capability (e.g., preservation of state variables). Standby components remain available at all times except for maintenance issues or recovery failures in progress.		PO			
SI-13 (1)		System and Information Integrity Predictable Failure Prevention Transferring Component Responsibilities		The organization takes information system components out of service by transferring component responsibilities to substitute components no later than [Assignment: organization-defined fraction or percentage] of mean time to failure.						
SI-13 (2)	2	System and Information Integrity Predictable Failure Prevention Time Limit on Process	Х							[Withdrawn: Incorporated into SI-7 (16)]
SI-13 (3)	2	Execution Without Supervision System and Information Integrity Predictable Failure Prevention Manual Transfer Between Components		The organization manually initiates transfers between active and standby information system components [Assignment: organization-defined frequency] if the mean time to failure exceeds [Assignment: organization-defined time period].						
SI-13 (4)	2	System and Information Integrity Predictable Failure Prevention Standby Component Installation / Notification		Inssignment: origination of information system component failures are detected: (a) Ensures that the standby components are successfully and transporently installed within [Assignment: organization-defined time period]; and (b) [Selection (one or more): activates [Assignment: organization-defined alarm]; automatically shuts down the information system].	Automatic or manual transfer of components from standby to active mode can occur, for example, upon detection of component failures.					
SI-13 (5)	2	System and Information Integrity Predictable Failure Prevention Failover Capability		The organization provides [Selection: real-time; near real-time] [Assignment: organization-defined failover capability] for the information system.	Failover refers to the automatic switchover to an alternate information system upon the failure of the primary information system. Failover capability includes, for example, incorporating mirrored information system operations at alternate processing sites or periodic data mirroring at regular intervals defined by recovery time periods of organizations.					
SI-14		System and Information Integrity Non-Persistence		The organization implements non-persistent [Assignment-organization-defined information system components and services] that are initiated in a known state and terminated [Selection (one or more): upon end of session of use; periodically at [Assignment: organization-defined frequency]].	the targeting capability of adversaries (I.e., window of opportunity and available attack surface) to initize and complete cyber attacks. By implementing the concept of non-persistence for selected information system components, organizations can provide a known state computing resource for a specific period of time that does not give adversaries sufficient time on target to exploit vulnerabilities in organizational information systems and the environments in which those systems operate. Since the advanced persistent threat is a high-end threat with regard to capability, intent, and targeting, organizations assume that over an extended period of time, a percentage of cyber attacks will be successful. Non-persistent information system components and services are activated as required using protected information and terminated periodically or upon the end of sessions. Non-persistence increases the work factor of adversaries in attempting to compromise or breach organizational information systems. Non-persistent system components can be implemented, for example, by periodically re-imaging components or by using a variety of common virtualization techniques. Non-persistent). The benefit of periodic refreshes of information system components or of virtual machines or as new instances of processes on physical machines (either persistent or non-persistent). The benefit of periodic refreshes of information system components or of virtual machines. In does not require organizations to distentine). The refresh of selected information system components and services occurs with sufficient frequency to prevent the spread or intended impact of attacks, but not with such frequency that it makes the information system unstable. In some instances, refreshes of critical components and services may be done periodically in order to hinder the ability of adversaries to exploit optimum windows of vulnerabilities.		PO			
SI-14 (1)		System and Information Integrity Non- Persistence Refresh from Trusted Sources		The organization ensures that software and data employed during information system component and service refreshes are obtained from [Assignment: organization-defined trusted sources].	from selected off-line secure storage facilities.					
SI-15		System and Information Integrity Information Output Filtering		The information system validates information output from [Assignment: organization-defined software programs and/or applications] to ensure that the information is consistent with the expected content.	Certain types of cyber attacks (e.g., SQL injections) produce output results that are unexpected or inconsistent with the output results that would normally be expected from software programs or applications. This control enhancement focuses on detecting extraneous content, preventing such extraneous content from being displayed, and alerting monitoring tools that anomalous behavior has been discovered.	SI-3,SI-4	PO			
SI-16	1	System and Information Integrity Memory Protection		The information system implements [Assignment: organization-defined security safeguards] to protect its memory from unauthorized code execution.	Some adversaries launch attacks with the intent of executing code in non-executable regions of memory or in memory locations that are prohibited. Security safeguards employed to protect memory include, for example, date axecution prevention and address space layout randomization. Data execution prevention safeguards can either be hardware-enforced or software-enforced with hardware providing the greater strength of mechanism.	AC-25,SC-3	P1	X	x	
SI-17	1	System and Information Integrity Fail-Safe Procedures		The information system implements [Assignment: organization-defined fail-safe procedures] when [Assignment: organization-defined failure conditions occur].	Failure conditions include, for example, loss of communications among critical system components or between system components and operational facilities. Fail-safe procedures include, for example, alerting operator personnel and providing specific instructions on subsequent steps to take (e.g., do nothing, reestablish system settings, shut down processes, restart the system, or contact designated organizational personnel). Control ID	Level	Control Name	Withdrawn	Control Text	Supplemental Guidance	Related Controls	Priority Low	Mod High	Notes
CONTROLLO		Control Name Transparency Privacy Notice	withdrawn	The organization: a. Provides effective notice to the public and to individuals regarding: (i) its activities that impact privacy, including its collection, use, sharing, safeguarding, maintenance, and disposal of personally	Effective notice, by virtue of its clarity, readability, and comprehensiveness, enables individuals to understand how an organization uses Pilg enerally and, where appropriate, to make an informed decision prior to providing PII to an organization. Heffective notice also demonstrates the privacy considerations that the organization has addressed in implementing its information practices. The organization may provide general public notice through a variety of means, as required by law or policy, including System of Records Notices (SQRNS), Privacy Impact Assessments (PIAQ), or in a website privacy policy. As required by the Privacy Act, the organization also provides direct notice to individuals via Privacy Act Statements on the paper and electronic forms it uses to collect PII, or on separate forms that can be retained by the individuals. The organization Senior Agency Official for Privacy (SAOP)/Chief Privacy Officer (CPO) is responsible for the content of the organization's public notices, in consultation with legal counsel and relevant program managers. The public notice requirement in this control is satisfied by an organization's compliance with the public notice provisions of the Privacy Act, the E-Government Act's PIA requirement, with OMB guidance related to federal agency privacy notices, and, where applicable, with policy pertaining to participation in the Information Sharing Environment (ES). Changing Pil practice or policy without prior notice is disfavored and should only be undertaken in consultation with the SAOP/CPO and counsel. The Information Sharing Environment is an approach that facilitates the sharing of terrorism and homeland security information. The ISE was established by the Intelligence Reform and Terrorism Prevention Act of 2004, Public Law 108-458, 118 Stat. 3638. See the ISE website at: http://www.ise.gov.	AP-1, AP-2, AR-1, AR-	riony tow	mod High	Notes [Privacy Controls]
TR-1 (1)	2	Transparency Privacy Notice Real-Time or Layered Notice		The organization provides real-time and/or layered notice when it collects PII.	Real-time notice is defined as notice at the point of collection. A layered notice approach involves providing individuals with a summary of key points in the organization's privacy policy. A second notice provides more detailed/specific information.				[Privacy Controls]
TR-2	1	Transparency System of Records Notices and Privacy Act Statements		The organization: a. Publishes System of Records Notices (SORNs) in the Federal Register, subject to required oversight processes, for systems containing personally identifiable information (PII); b. Keeps SORNs current; and c. Includes Privary Act Statements on its forms that collect PII, or on separate forms that can be retained by individuals, to provide additional formal notice to individuals from whom the information is being collected.	Organizations issue SORNs to provide the public notice regarding PII collected in a system of records, which the Privacy Act defines as "a group of any records under the control of any agency from which information is retrieved by the name of an individual or by some identifying number, symbol, or other identifier." SORNs explain how the information is used, retained, and may be corrected, and whether cetain portions of the system are subject to Privacy Act exemptions for law enforcement or national security reasons. Privacy Act Statements provide notice of: [0] the authority of organizations to collect PII; [ii] whether providing PII is mandatory or optional; (iii) the principal purpose(s) for which the PII is to be used; (iv) the intended disclosures (routine uses) of the information; and (v) the consequences of not providing all or some portion of the information requested. When information is collected verbally, organizations read a Privacy Act Statement prior to initiating the collection of PII (for example, when conducting telephone interviews or surveys).	DI-2			[Privacy Controls]
TR-2 (1)	2	Transparency System of Records Notices and Privacy Act Statements Public Website Publication		The organization publishes SORNs on its public website.					[Privacy Controls]
TR-3	1	Transparency Dissemination of Privacy Program Information		The organization: a. Ensures that the public has access to information about its privacy activities and is able to communicate with its Senior Agency Official for Privacy (SAOP)/Chief Privacy (Officer (CPO); and b. Ensures that its privacy practices are publicly available through organizational websites or otherwise.	Organizations employ different mechanisms for informing the public about their privacy practices including, but not limited to, Privacy Impact Assessments (PIAS), System of Records Notices (SORNs), privacy reports, publicly available web pages, email distributions, blogs, and periodic publications (e.g., quarterly newsletters). Organizations also employ publicly facing email addresses and/or phone lines that enable the public to provide feedback and/or direct questions to privacy offices regarding privacy practices.	AR-6			[Privacy Controls]
UL	0	Use Limitation							[Privacy Controls]
UL-1		Use Limitation Internal Use		The organization uses personally identifiable information (PIII) internally only for the authorized purpose(s) identified in the Privacy Act and/or in public notices.	These steps include monitoring and auditing organizational use of PII and training organizational personnel on the authorized uses of PII. With guidance from the Senior Agency Official for Privacy (SAD/C)/Leif Privacy Officer (CPO) and where appropriate, legal counsel, organizations document processes and procedures for evaluating any proposed new uses of PII to assess whether they fall within the scope of the organizational authorities. Where appropriate, organizations obtain consent from individuals for the new use(s) of PII.	4, AR-5, IP-1, TR-1, TR-2			[Privacy Controls]
UL-2	1	Use Limitation Information Sharing with Third Parties		The organization: a. Shares personally identifiable information (PII) externally, only for the authorized purposes identified in the Privacy Act and/or described in its notice(s) or for a purpose that is compatible with those purposes; b. Where appropriate, enters into Memoranda of Understanding, Memoranda of Agreement, Letters of Intent, Computer Matching Agreements, or similar agreements, with third parties that specifically describe the PII covered and specifically describe the PII covered and specifically describe the PII overed and specifically enumerate the purposes for which the PII may be used; c. Monitors, audits, and trains its staff on the authorized sharing of PII with third parties and on the consequences of unauthorized use or sharing of PII; and d. Evaluates any proposed new instances of sharing PII with third parties to assess whether the sharing is authorized and whether additional or new public notice is required.	where appropriate, legal coursel review and approve any proposed external sharing of PII, including with other public, international, or private sector entities, for consistency with uses described in the existing organizational public notice(s). When a proposed new instance of external sharing of PII is not currently authorized by the Pivacy Act and/or specified in a notice, organizations evaluate whether the proposed external sharing is compatible with the purpose(s) specified in the notice. If the proposed sharing is compatible, organizations review, update, and republish their Privacy Impact Assessments (PIAS), System of Records				[Privacy Controls]
