Control Names have been modified for usability: 1) Family Name appended, as "Family Name Original Control Name" 2) Space added between Control ID and Enhancement #i, as "ID (#)" 4) Capitalized as titles, instead of all supercase. - Missing content added for: M-S (2), MA-4 (4). - Fixed formatting of Assignments and Selections. - Content derived from the "Spreadsheet version of 800-53 FPD controls (xls)", located at the link below. *** https://csrc.nist.gov/publications/detail/sp/800-53/rev-5/draft
AC AC-1		Access Control Policy and Procedures		a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more]: organization-level; mission/business process-level; system-level] access control policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the access control policy and the associated access controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the access control policy and procedures; and c. Review and update the current access control 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the AC family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and rivacy programs collaborate on their development. Security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy polgrams and for systems, if needed. Procedures describe how the policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.		"Control Family" is the official name for Level 0. "Control" is the official name for Level 1.
AC-2	1	Access Control Account Management		a. Define and document the types of accounts allowed for use within the system; b. Assign account managers; C. Stablish conditions for group and role membership; d. Specify. C. Stablish conditions for group and role membership; d. Specify. L. Authorized users of the system; 2. Group and role membership; and S. Access authorizations (i.e., privileges) and [Assignment: organization-defined attributes (as required)] for each account; e. Require approvals by [Assignment: organization-defined personnel or roles] for requests to create accounts; f. Create, enable, modify, disable, and remove accounts in accordance with [Assignment: organization-defined personnel or roles] for requests to create accounts; h. Notify account managers and [Assignment: organization-defined personnel or roles] within: 1. [Assignment: organization-defined time-period] when accounts are no longer required; 2. [Assignment: organization-defined time-period] when users are terminated or transferred; and 3. [Assignment: organization-defined time-period] when system usage or need-to-know changes for an individual; 1. A valid access authorization; 2. Intended system usage; and 3. [Assignment: organization-defined attributes (as required)]; 1. Review accounts for compliance with account management requirements [Assignment: organization-defined frequency]; k. Establish and implement a process for changing shared or group account credentials (if deployed) when individuals are removed from the group; and 1. Align account management processes with personnel termination and transfer processes.	leamples of system account types include individual, shared, group, system, guest, anonymous, emergency, developer, temporary, and service, Selentiation of authorized system serva and the specification of access privileges reflects the requirements in other controls in the security plan. Users requiring administrative privileges on system accounts review additional country by organizational personnel reprovible for approving such accounts and privileged access, including system owner, mission or business owner, serior agency information security officer, or serior agency information security officer, or serior agency fine of privacy. External system accounts are not included in the scope of this control. Cinganizations address external system accounts through organizational policy. Where access involves personally identified informations, exercity programs collaborate with the senior agency official for privacy to the privacy. External system accounts are collaborate with the senior agency official for privacy can establishing the specific conditions for group and role memberships, specifying for each account, authorized owns, prough and free membership, and account account, authorized owns, prough and reliable informations, excess subtractizations, and creating, adjusting, or accounts of the service of the activities of accounts. Organizations and creating, adjusting, or other activities are proposed to the activities of accounts. Organizations are provided to the account account activities of the activities requirements. Failure to consider these factors could affect system availability. The proposal and mission/business requirements. Failure to consider these factors could affect system availability. The proposal and mission/business requirements. Failure to consider these factors could affect system accounts without the demand for immediacy in account activation. Organizations stability here accounts without the commonal account activation in procedure when there is a need for short-term accounts without th	AC3, AC5, AC6, AC 17, AC18, AC20, AC 42, AU2, AU1-12, CM 5, IA-2, IA-4, IA-5, IA-8, J. MA-3, MA-5, CP 12, P4, P5-2, P5-4, P5- 5, P5-7, SC-7, SC-13, SC-37	
AC-2 (1)	2	Access Control Account Management Automated System Account Management		Support the management of system accounts using [Assignment: organization-defined automated mechanisms].	Automated mechanisms include using email or text messaging to automatically notify account managers when users are terminated or transferred; using the system to monitor account usage; and using telephonic notification to report atypical system account usage.		"Control Enhancement" is the official name for Level 2.
AC-2 (2)		Access Control Account Management Automated Temporary and Emergency Account Management		Automatically [Selection: remove; disable] temporary and emergency accounts ofter [Assignment: organization- defined time-period for each type of account].	Management of temporary and emergency accounts includes the removal or disabling of such accounts automatically after a predefined time-period, rather than at the convenience of the systems administrator. Automatic removal or disabling of accounts provides a more consistent implementation.		
AC-2 (3)		Access Control Account Management Disable Accounts		Disable accounts when the accounts: (a) Have expliced; (b) Are no longer associated with a user or individual; (c) Are in violation of organizational policy; or (d) Have been inotive for [Assignment: organization-defined time-period].	Disabling expired, inactive, or otherwise anomalous accounts supports the concept of least privilege and least functionality which reduces the attack surface of the system.		
AC-2 (4)	2	Access Control Account Management Automated Audit Actions Access Control Account Management Inactivity Logout		Automatically audit account creation, modification, enabling, disabling, and removal actions. Require that users log out when [Assignment: organization-defined time-period of expected inactivity or description of when to log out].	Account management audit records are defined in accordance with AU-2 and reviewed, analyzed, and reported in accordance with AU-5. Inactivity logout is behavior or policy-based and requires users to take physical action to log out when they are expecting inactivity longer than the defined period. Automatic enforcement of this control enhancement is addressed by AC-11.	AU-2, AU-6 AC-11	
AC-2 (6)	2	Access Control Account Management Dynamic Privilege Management		Implement [Assignment: organization-defined dynamic privilege management capabilities].	In contrast to access control approaches that employ static accounts and predefined user privileges, dynamic access control approaches rely on run time access control decisions facilitated by dynamic privilege management such as attribute-bosed access control. While user identities remain relatively constant over time, user privilegest sypically change more frequently based on angoing mission or business requirements and operational needs of arganizations. An example of dynamic privilege management is the immediate revocation of privileges from users, as opposed to requiring that users terminate and restart their sessions to reflect changes in privileges. Dynamic privilege management can also include mechanisms that change user privileges based on dynamic rules as opposed to editing specific user profiles. Examples include automatic adjustments of user privileges! If they are provilege of their inamia work times, their job function or assignment changes, or if systems are under duress or in emergency situations. Dynamic privilege management includes the effects of privilege changes, for example, when there are changes to encryption keys used for communications.	AC-16	

Commelia		Control Name	Control Tout	Discovering	Deleted Controls	Makes
Control ID	2	Control Name Withdra		Privileged roles are organization defined roles assigned to individuals that all the	Related Controls	Notes
AC-2 (7)	2	Access Control Account Management Privileged User Accounts	 (a) Establish and administer privileged user accounts in accordance with [Selection: a role-based access scheme an attribute-based access scheme]; (b) Manitor privileged role or attribute assignments; (c) Monitor changes to roles or attributes; and (d) Revoke access when privileged role or attribute assignments are no longer appropriate. 	; Privileged roles are organization-defined roles assigned to individuols that allow those individuols to perform certain security-relevant functions that ordinary users are not authorized to perform. Privileged roles include key management, account management, database administration, system and network administration, and web administration. A role-based access scheme organizes permitted system access and privileges into roles. In contrast, an attribute-based access scheme specifies allowed system access and privileges based an attributes.	AC-3	
AC-2 (8)	2	Access Control Account Management Dynamic Account Management	Create, activate, manage, and deactivate [Assignment: organization-defined system accounts] dynomically.	Approaches for dynamically creating, octivating, managing, and deactivating system accounts rely on automatically provisioning the accounts at run time for entitles that were previously unknown. Organizations plan for the dynamic management, creation, activation, and deactivation of system accounts by establishing trust relationships, business rules, and mechanisms with appropriate authorities to validate related authorizations and privileges.	AC-16	
AC-2 (9)		Access Control Account Management Restrictions on Use of Shared and Group Accounts	Only permit the use of shared and group accounts that meet [Assignment: organization-defined conditions for establishing shared and group accounts].	Before permitting the use of shared or group accounts, organizations consider the increased risk due to the lack of accountability with such accounts.		
AC-2 (10)	2	Access Control Account Management Shared and Group Account Credential Change	X			[Withdrawn: Incorporated into AC-2.k]
AC-2 (11)	2	Access Control Account Management Usage Conditions	Enforce [Assignment: organization-defined circumstances and/or usage conditions] for [Assignment: organization-defined system accounts].	Specifying and enforcing usage conditions helps to enforce the principle of least privilege, increase user accountability, and enable effective account monitoring. Account monitoring includes olers generated if the account is used in violation of organizational parameters. Organizations can describe specific conditions or circumstances under which system accounts can be used, for example, by restricting usage to certain days of the week, time of day, or specific durations of time.		
AC-2 (12)		Access Control Account Monogement Account Monitoring for Atypical Usage	(a) Monitor system accounts for [Assignment: organization-defined atypical usage]; and (b) Report atypical usage of system accounts to [Assignment: organization-defined personnel or roles].	Atypical usage includes accessing systems at certain times of the day or from locations that are not consistent with the normal usage patterns of individuals working in organizations. Account monitoring may inadvertently create privacy risks. Data Collected to identify atypical usage may reveal previously unknown information about the behavior of individuals. Organizations assess and document privacy risks from monitoring accounts for atypical usage in their privacy impact assessment and make determinations that are in alignment with their privacy program plan.		
AC-2 (13)	2	Access Control Account Management Disable Accounts for High-risk Individuals	Disable accounts of users within [Assignment: organization-defined time-period] of discovery of [Assignment: organization-defined significant risks].	Users posing a significant security and/or privacy risk include individuals for wham reliable evidence indicates either the intention to use authorized access to systems to cause horm or through whom adversaries will cause horm. Such harm includes the adverse impacts to organizational operations, organizational assets, individuals, other organizations, or the Nation. Close coordination among system administrators, legal staff, human resource managers, and authorizing officials is essential for execution of this control enhancement.		
AC-2 (14)	2	Access Control Account Management Prohibit Specific Account Types	Prohibit the use of [Selection (one or more): shared; guest; anonymous; temporary; emergency] accounts for access to [Assignment: organization-defined information types].	Organizations determine what types of accounts are prohibited based on the security and privacy risk.	PS-4	
AC-3	1	Access Control Access Enforcement	Enforce approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	Access control policies control access between active entities or subjects (i.e., users or processes acting on behalf of users) and passive mettles or objects (i.e., devices, files, records, domains) in organizational systems. In addition to enforcing authorized access at the system level and recognizing that systems can host many applications and services in support of missions and business functions, access enforcement mechanisms can also be employed at the application and service level to provide increased information security and privacy. In contrast to logical access controls that are implemented within the system, physical access controls are addressed by the controls in the Physical and Environmental Protection (PE) family.	AC-2, AC-4, AC-5, AC-6, AC-17, AC-18, AC-19, AC-20, AC-21, AC-22, AC-24, AC-25, AT-2, AT-3, AU-9, CM-5, CM-11, IA-2, IA-5, IA-6, IA-7, IA-11, MA-3, MA-4, MA-5, MP-4, PM-2, PS-3, SA-17, SC-2, SC-3, SC-4, SC-13, SC-24, SC-34, SI-4	
AC-3 (1)	2	Access Control Access Enforcement Restricted Access to Privileged Functions	X			[Withdrawn: Incorporated into AC-6]
AC-3 (2)	2	Access Control Access Enforcement Dual Authorization	Enforce dual authorization for [Assignment: organization-defined privileged commands and/or other organization-defined actions].	Dual authorization, also known as two-person control, reduces risk related to insider threat. Dual authorization mechanisms require the approval of two authorized individuals to execute. To reduce the risk of collusion, organizations consider rotating dual authorization duties to other individuals. Organizations do not require dual authorization mechanisms when immediate responses are necessary to ensure public and environmental safety.	CP-9, MP-6	
AC-3 (3)	2	Access Control Access Enforcement Mandatory Access Control	Enforce (Assignment: organization-defined mandatory access control policy) over the set of covered subjects and objects specified in the policy, and where the policy: (a) is uniformly enforced across the covered subjects and objects within the system; (b) Specifies that a subject that has been granted access to information is constrained from doing any of the following; (1) Passing the information to unauthorized subjects or objects; (2) Granting its privileges to other subjects; (3) Changing one or more security attributes (specified by the policy) on subjects, objects, the system, or system components; (4) Choosing the security attributes and attribute values (specified by the policy) to be associated with newly created or modified objects; and (5) Changing the rules governing access control; and (c) Specifies that (Assignment: organization-defined subjects) may explicitly be granted (Assignment: organization-defined privileges) such that they are not limited by any defined subset (or all) of the above constraints.	policies constrain what actions subjects can take with information obtained from objects for which they have already been granted access. This prevents the subjects from passing the information to unauthorized subjects and objects. Mandatory access control policies constrain actions subjects can take with respect to the propagation of access control privileges; that is, a subject with a privilege cannot pass that privilege to other subjects. The policy is unfirmly enforced over all subjects and objects to which the system has control; otherwise, the access control policy can be		

					Related Controls	
AC-3 (4)	Level 2	Access Control Access Enforcement Discretionary Access Control	Enforce [Assignment: organization-defined discretionary access control policy] over the set of covered subjects and objects specified in the policy, and where the policy specifies that a subject that has been granted access to information and one or more of the following: (a) Pass the information to any other subjects or objects; (b) Grant its privileges to other subjects, (c) Change security attributes on subjects, objects, the system, or the system's components; (d) Choose the security attributes to be associated with newly created or revised objects; or (e) Change the rules governing access control.	When discretionary access control policies are implemented, subjects are not constrained regarding what actions they can take with information for which they have already been aronated access. Thus, subjects that have been granted access to information or not prevented from passing the information to other subjects or objects (i.e., subjects have the discretion to pass). Discretionary access control can operate in conjunction with mandatory access control as described in Ac-3(3) and Ac-3(15). A subject that is constrained in its operation by mandatory access control policies can still operate under the less rigorous constraints of discretionary access control in Periode, while Ac-3(3) imposes constraints preventing a subject (pare passing information to another subject operating at a different sensitivity level. AC-3(4) permits he subject to pass the information to any subject at the same sensitivity level. The policy is bounded by the system. Once the information is passed outside of system control, additional means may be required to ensure that the constraints remain in effect. While traditional definitions of discretionary access control require definitive based access control, that limitation is not required for this particular use of discretionary access control.	mentee Controls	
AC-3 (5)	2	Access Control Access Enforcement Security- relevant Information	Prevent access to [Assignment: organization-defined security-relevant information] except during secure, non- operable system states.	Security-relevant information is information within systems that can potentially impact the operation of security functions or the provision of security services in a manner that could result in failure to enforce system security policies or maintain the separation of code and data. Security-relevant information includes access control lists, filtering rules for routers or firewalls, configuration parameters for security services, and cryptographic key management information. Secure, non-operable system states include the times in which systems are not performing mission or business-related processing such as when the system is off-line for maintenance, boot-up, troubleshooting, or shut down.	CM-6, SC-39	
AC-3 (6)	2	Access Control Access Enforcement Protection of User and System Information				[Withdrawn: Incorporated into MP-4, SC-28]
AC-3 (7)	2	User and system information Access Control Access Enforcement Role-based Access Control	Enforce a role-based access control policy over defined subjects and objects and control access based upon [Assignment: organization-defined roles and users authorized to assume such roles].	Role-based access control (RBAC) is an access control policy that enforces access to objects and system functions based on the defined role (i.e., job function) of the subject. Organizations can create specific roles based on job functions and the authorizations (i.e., privilege) to perform needed operations on the systems associated with the arganization-defined roles. When users are assigned to the specific roles, they inherit the authorizations or privileges defined for those roles. RBAC simplifies privilege administration for because privileges are not assigned directly to every user (which can potentially be a large number of individually but are instead caquired through role assignments. RBAC can be implemented as a mandatory or discretionary form of access control. For those organizations implementing RBAC with mandatory occess controls, the requirements in AC-3(3) define the scope of the subjects and objects covered by the policy.		
AC-3 (8)	2	Access Control Access Enforcement Revocation of Access Authorizations	Enforce the revocation of access authorizations resulting from changes to the security attributes of subjects and objects based on [Assignment: organization-defined rules governing the timing of revocations of access authorizations].	Revocation of access rules may differ based on the types of access revoked. For example, if a subject (i.e., user or process acting on behalf of a user) is removed from a group, access may not be revoked until the next time the object is opened or the next time the subject attempts a new access to the object. Revocation based on changes to security labels may take effect immediately. Organizations provide alternative approaches on how to make revocations immediate if systems cannot provide such capability and immediate revocation is necessary.		
AC-3 (9)	2	Access Control Access Enforcement Controlled Release	Release information outside of the system only if: (a) The receiving [Assignment: organization-defined system or system component] provides [Assignment: organization-defined controls]; and (b) [Assignment: organization-defined controls] are used to validate the appropriateness of the information designated for release.	Systems can only protect organizational information within the confines of established	CA-3, PT-2, PT-3, PT- 8, SA-9, SC-16	
AC-3 (10)	2	Access Control Access Enforcement Audited Override of Access Control Mechanisms	Employ an audited override of automated access control mechanisms under [Assignment: organization-defined conditions] by [Assignment: organization-defined roles].		AU-2, AU-6, AU-10, AU-12, AU-14	
AC-3 (11)	2	Access Control Access Enforcement Restrict Access to Specific Information Types	Restrict access to data repositories containing (Assignment: organization-defined information types).	Restricting access to specific information is intended to provide flexibility regarding occess control of specific information types within a system. For example, role-bosed access could be employed to allow access to only a specific type of personally identifiable information within a database rather than allowing access to the database in its entirety. Other examples include restricting access to cryptographic keys, authentication information, and selected system information.		
AC-3 (12)	2	Access Control Access Enforcement Assert and Enforce Application Access	(a) Require applications to assert, as port of the installation process, the access needed to the following system applications and functions: [Assignment: organization-defined system applications and functions]; (b) Provide an enforcement mechanism to prevent unauthorized access; and (c) Approve access changes after initial installation of the application.	Asserting and enforcing application access is intended to address applications that need to access existing system applications and functions, including user contacts, global positioning system, camera, keyboard, microphone, network, phones, or other files.	CM-7	

Control ID I	Lovel Control Name	Control Text	Discussion	Related Controls Notes
AC-3 (13)	Control Name Access Control Access Enforcement Attribute-based Access Control	Enforce attribute-based access control policy over defined subjects and objects and control access based upon [Assignment: organization-defined attributes to assume access permissions].	Attribute-based access control is an access control policy that restricts system access to authorized users based on specified organizational attributes (e.g., job function, identity); action attributes (e.g., read, write, delete); environmental attributes (e.g., time of day, location); and resource attributes (e.g., class)fication of a document). Organizations can create rules based on attributes and the authorizations (i.e., privileges) to perform needed operations on the systems associated with the organization-defined attributes and rules. When users are assigned to attributes defined in attribute-based access control policies or rules; they can be provisioned to a system with the appropriate privileges or dynamically granted access to a protected resource upon access. Attribute-based access control can be implemented as a mandatory or discretionary form of access control. For attribute-based access control implemented with mandatory occess controls, the requirements in AC-3(3) define the scope of the subjects and objects covered by the policy.	
AC-3 (14)	Access	Provide [Assignment: organization-defined mechanisms] to enable individuals to have access to the following elements of their personally identifiable information: [Assignment: organization-defined elements].	Individual access affords individuals the ability to review personally identifiable information about them held within arganizational records, regardless of format. Access helps individuals to develop an understanding about how their personally identifiable information is being processed. It can also help individuals ensure that their data is accurate. Access mechanisms can include request forms and application interfaces. Access to certain types of records may not be appropriate or may require certain levels of authentication assurance. Organizational personnel consult with the senior agency official for privacy and legal counsel to determine appropriate mechanisms and access rights or limitations.	18
AC-3 (15)	Access Control Access Enforcement Discretionary and Mandatory Access Control	[a) Enforce [Assignment: organization-defined mandatory access control policy] over the set of covered subjects and objects specified in the policy; and [b) Enforce [Assignment: organization-defined discretionary access control policy] over the set of covered subjects and objects specified in the policy.	Implementing a mandatory access control policy and a discretionary access control policy simultaneously can provide additional pratection against the unauntainzed execution of code by users or processes acting on behalf of users. This helps prevent a single compromised user or process from compromising the entire system.	SC-2, SC-3, AC-4
AC-4	1 Access Control Information Flow Enforcement	Enforce approved authorizations for controlling the flow of information within the system and between connected systems based on [Assignment: organization-defined information flow control policies].	the clear to the Internation the internal to the Internation to the Internal to the Internation to the Internal to Internation	AC-3, AC-16, AC-11, AC-11, AC-19, AC-21, AC-11, AC-19, AC-21, AL-11, AC-19, AC-21, AL-11, AC-21, AC-
AC-4 (1)	Access Control Information Flow Enforcement Object Security and Privacy Attributes	Use [Assignment: organization-defined security and privacy attributes] associated with [Assignment: organization-defined information, source, and destination objects] to enforce [Assignment: organization-defined information flow control policies] as a basis for flow control decisions.	Information flow enforcement mechanisms compare security and privacy attributes associated with information (i.e., data content and structure) and source and destination objects and respond appropriately when the enforcement mechanisms encounter information flows notices. For example, an information object labeled Secret would be allowed to flow to a destination object labeled Secret, but on information object labeled Secret, and information object labeled Secret, but on information object labeled Secret, a dataset of personally identifiable information may be tagged with restrictions against combining with other types of datasets, and therefore, would not be allowed to flow to the restricted dataset. Security and privacy attributes can also include source and destination addresses employed in traffic filter freewalls. Flow enforcement using exploit security or privacy attributes can be used, for example, to control the release of certain types of information.	
AC-4 (2)	Access Control Information Flow Enforcement Processing Domains	Use protected processing domains to enforce [Assignment: organization-defined information flow control policies] as a basis for flow control decisions.	Protected processing domains within systems are processing spaces that have controlled interactions with other processing spaces, enabling control of information flows between these spaces and to/from information objects. A protected processing domain can be provided, for example, by implementing domain and type enforcement. In domain and type enforcement, in domain and type enforcement, in domain and type enforcement is identified by types; and information flows are controlled based on allowed information accesses (i.e., determined by domain and type), illowed signaling among domains, and allowed process transitions to other domains.	SC-39
AC-4 (3)	Dynamic Information Flow Control	Enforce (Assignment: organization-defined information flow control policies).	disallowing information flows based on changing conditions or mission or operational considerations. Changing conditions include changes in risk tolerance due to changes in the immediacy of mission or obusiness needs, changes in the threat environment, and detection of potentially harmful or adverse events.	SI-4
AC-4 (4)	Control of Encrypted Information	Prevent encrypted information from bypassing [Assignment: organization-defined information flow control mechanisms] by [Selection (one or more): decrypting the information; blocking the flow of the encrypted information; enrinating communications sessions attempting to pass encrypted information:[Assignment: organization-defined procedure or method]].	identifiers. The term encryption is extended to cover encoded data not recognized by filtering mechanisms.	SI-4
AC-4 (5)	2 Access Control Information Flow Enforcement Embedded Data Types	Enforce [Assignment: organization-defined limitations] on embedding data types within other data types.	Embedding data types within other data types may result in reduced flow control effectiveness. Data type embedding includes inserting files as objects within other files and using compressed or archived data types that may include multiple embedded data types. Limitations on data type embedding consider the levels of embedding and prohibit levels of data type embedding that are beyond the capability of the inspection tools.	

Control ID	Laurel	Control Nove	Control Tout	Diamodan	Deleted Controls	Makes
control ID	evel	Control Name Withdrawn	Control Text	Discussion Metadata is information that describes the characteristics of data. Metadata can include	AC 16 SUZ	Notes
AC-4 (6)	2	Access Control Information Flow Enforcement Metadata	Enforce information flow control based on [Assignment: organization-defined metadata].	Metaada is information that asscribes the characteristic of pata. Metaada can include structural metadata describing load as tructures or descriptive metadata describing data content. Enforcement of allowed information flows based on metadata enables simpler and more effective flow control. Organizations consider the trustworthiness of metadata regarding data accuracy (i.e., knowledge that the metadata values are correct with respect to the data), data integrity (i.e., protecting against unauthorized changes to metadata tags), and the binding of metadata to the data poyload (i.e., ensuring sufficiently strong binding techniques with appropriate levels of assurance).	AC-16, SI-7	
AC-4 (7)	2	Access Control Information Flow Enforcement One- way Flow Mechanisms	Enforce one-way information flows through hardware-based flow control mechanisms.	One-way flow mechanisms may also be referred to as a unidirectional network, unidirectional security gateway, or data diode. One-way flow mechanisms can be used to prevent data from being exported from a higher impact or classified domain or system, while permitting data from a lower impact or unclassified domain or system to be imported.		
AC-4 (8)	2	Access Control Information Flow Enforcement Security and Privacy Policy Filters	(a) Enforce information flow control using [Assignment: organization-defined security or privacy policy filters] as a basis for flow control decisions for [Assignment: organization-defined information flows]; and (b) [Seection (no eor orner): block; strip; molify; quarantine] data ofter a filter processing failure in accordance with [Assignment: organization-defined security or privacy policy].	Organization-defined security or privacy policy filters can address data structures and content. For example, security or privacy policy filters for data structures can check for maximum file lengths, maximum file leads see, and danfile types (for structured and unstructured data). Security or privacy policy filters for data content can check for specific words enumerated values or data value ranges, and hidden content. Structured data permits the interpretation of data content by applications. Unstructured data refers to digital information without a data structure or with a data structure that does not facilitate the development of rule sets to address the sensitivity of the information conveyed by the data or the flow enforcement decisions. Unstructured data consists of bitmap objects that are inherently non-language-based (i.e., image, whice, or audio files), and textual objects that are based on written or printed languages. Organizations can implement more than one security or privacy policy filter to meet information flow control objectives.		
AC-4 (9)	2	Access Control Information Flow Enforcement Human Reviews	Enforce the use of human reviews for [Assignment: organization-defined information flows] under the following conditions: [Assignment: organization-defined conditions].	Organizations define security or privacy policy filters for all situations where automated flow control decisions are possible. When a fully automated flow control decision is not possible, then a human review may be employed in lieu of, or as a complement to, automated security or privacy policy filtering. Human reviews may also be employed as deemed necessary by organizations.		
AC-4 (10)	2	Access Control Information Flow Enforcement Enable and Disable Security or Privacy Policy Filters	Provide the capability for privileged administrators to enable and disable [Assignment: organization-defined security or privacy policy fliters] under the following conditions: [Assignment: organization-defined conditions].	For example, as allowed by the system authorization, administrators can enable security or privacy policy filters to accommodate approved data types. Administrators also have the capability to select the filters that are executed on a specific data flow based on the type of data that is being transferred, the source and destination security or privacy domains, and other security or privacy relevant features, as needed.		
AC-4 (11)	2	Access Control Information Flow Enforcement Configuration of Security or Privacy Policy Filters	Provide the capability for privileged administrators to configure [Assignment: organization-defined security or privacy policy filters] to support different security or privacy policies.	Documentation contains detailed information for configuring security or privacy policy filters. For example, administrators can configure security or privacy policy filters to include the list of "dirty words" that security or privacy policy mechanisms check in accordance with the definitions provided by organizations.		
AC-4 (12)	2	Access Control Information Flow Enforcement Data Type Identifiers	When transferring information between different security or privacy domains, use [Assignment: organization- defined data type identifiers] to validate data essential for information flow decisions.	Data type identiflers include filenames, file types, file signatures or tokens, and multiple internal file signatures or tokens. Systems allow transfer of data only if compliant with data type format specifications. Identification and validation of data types is based on defined specifications associated with each allowed data format. The filename and number alone are not used for data type identification. Content is validated syntactically and semantically against its specification to ensure it is the proper data type.		
AC-4 (13)	2	Access Control Information Flow Enforcement Decomposition into Policy-relevant Subcomponents	When transferring information between different security or privacy domains, decompose information into [Assignment: organization-defined policy-relevant subcomponents] for submission to policy enforcement mechanisms.	Decomposing information into policy-relevant subcomponents prior to information transfer facilitates policy decisions on source, destination, certificates, classification, attachments, and other security- or privacy-related component differentiators. Policy enforcement mechanisms apply littering, inspection, and/or sanitization uses to the policy-relevant subcomponents of information to facilitate flow enforcement prior to transferring such information to different security or privacy domains.		
AC-4 (14)	2	Access Control Information Flow Enforcement Security or Privacy Policy Filter Constraints	When transferring information between different security or privacy domains, implement [Assignment: organization-defined security or privacy policy filters] requiring fully enumerated formats that restrict data structure and content.	Data structure and content restrictions reduce the range of potential malicious or unsanctioned content in cross-domain transactions. Security or privacy policy filters that restrict data structures include restricting file sizes and field lengths. Data content policy filters include encoding formats for character sets; restricting character data fields to only contain alpha-numeric characters; prohibiting special characters; and validating schema structures.		
AC-4 (15)	2	Access Control Information Flow Enforcement Detection of Unsanctioned Information	When transferring information between different security or privacy domains, examine the information for the presence of [Assignment: organization-defined unsanctioned information] and prohibit the transfer of such information in accordance with the [Assignment: organization-defined security or privacy policy].	Unsanctioned information includes malicious code, dirty words, sensitive information inappropriate for release from the source network, or executable code that could disrupt or harm the services or systems on the destination network.	SI-3	
AC-4 (16)	2	Access Control Information Flow Enforcement X Information Transfers on Interconnected Systems				[Withdrawn: Incorporated into AC-4.
AC-4 (17)	2	Access Control Information Flow Enforcement Domain Authentication	Uniquely identify and authenticate source and destination points by [Selection (one or more): organization; system; application; service; individual] for information transfer.	Attribution is a critical component of a security and privacy concept of operations. The ability to identify source and destination points for information flowing within systems, allows the ferensic reconstruction of events, and encourages policy compliance by attributing policy violations to specific organizations or individuals. Successful domain authentication requires that system lobels distinguish among systems, organizations, and individuals involved in preparing, sending, receiving, or disseminating information. Attribution also allows organizations to better maintain the lineage of personally identifiable information processing as it flows through systems and can facilitate consent tracking, as well as correction, deletion, or access requests from individuals.	IA-2, IA-3, IA-9	
AC-4 (18)	2	Access Control Information Flow Enforcement X				[Withdrawn: Incorporated into AC-16.
AC-4 (19)	2	Security Attribute Binding Access Control Information Flow Enforcement Validation of Metadata	When transferring information between different security or privacy domains, implement [Assignment: organization-defined security or privacy policy filters] on metadata.	All information (including metadata and the data to which the metadata applies) is subject to filtering and inspection. Some organizations distinguish between metadata and data payloads (i.e., only the data to which the metadata is bound). Other organizations do not make such distinctions, considering metadata and the data to which the metadata applies as part of the payload.		
AC-4 (20)	2	Access Control Information Flow Enforcement Approved Solutions	Employ [Assignment: organization-defined solutions in approved configurations] to control the flow of [Assignment: organization-defined information] across security or privacy domains.	as part of the polyudua. Organizations define approved solutions and configurations in cross-domain policies and guidance in accordance with the types of information flows across classification boundaries. The NSA National Cross Domain Strategy and Management Office provides a baseline listing of approved cross-domain solutions.		

Control ID I	ovel	Control Name Withdrawn	Control Text	Discussion	Related Controls Notes
AC-4 (21)	2	Access Control Information Flow Enforcement	Separate information flows logically or physically using [Assignment: organization-defined mechanisms and/or	Enforcing the separation of information flows associated with defined types of data can	SC-32 Notes
	-	Physical or Logical Separation of Information Flows	techniques] to accomplish [Assignment: organization-defined required separations by types of information].	enhance pratection by ensuring that information is not commingled while in transit and by enabling flow control by transmission paths perhaps not otherwise achievable. Types of separable information include inbound and outbound communications traffic, service requests and responses, and information of differing security categories.	
AC-4 (22)		Access Control Information Flow Enforcement Access Only	Provide access from a single device to computing platforms, applications, or data residing in multiple different security domains, while preventing any information flow between the different security domains.	The system provides a capability for users to access each connected security domain without providing any mechanisms to allow transfer of data or information between the different security domains. An example of an access-only solution is a terminal that provides a user access to information with different security classifications while assuredly keeping the information separate.	
AC-4 (23)		Access Control Information Flow Enforcement Modify Non-releasable Information	When transferring information between different security domains, modify non-releasable information by implementing [Assignment: organization-defined modification action].	Modifying non-releasable information can help prevent a data spill or attack when information is transferred across security domains. Modification actions include masking, permutation, alteration, removal, or redaction.	
AC-4 (24)	2	Access Control Information Flow Enforcement Internal Normalized Format	When transferring information between different security domains, parse incoming data into an internal normalized format and regenerate the data to be consistent with its intended specification.	Converting data into normalized forms is one of most of effective mechanisms to stop malicious attacks and large classes of data exfiltration.	
AC-4 (25)	2	Access Control Information Flow Enforcement Data Sanitization	When transferring information between different security domains, sanitize data to minimize [Selection (one or more): delivery of malicious content, command and control of malicious code, malicious code augmentation, and steganography encoded data; spillage of sensitive information] in accordance with [Assignment: organization- defined policy]].	hard copy form.	
AC-4 (26)		Access Control Information Flow Enforcement Audit Filtering Actions	When transferring information between different security domains, record and audit content filtering actions and results for the information being filtered.	Content filtering is the process of inspecting information as it troverses a cross domain solution and determines! the information mets a pre-defined policy. Content filtering actions and results of filtering actions are recorded for individual messages to ensure the correct filter actions were applied. Content filter reports are used to assist in troubleshooting actions, for example, determining why message content was modified and/or why it failed the filtering process. Audit events are defined in AU-2. Audit records are generated in AU-12.	AU-2, AU-3, AU-12
AC-4 (27)	2	Access Control Information Flow Enforcement Redundant/Independent Filtering Mechanisms	When transferring information between different security or privacy domains, implement content filtering solutions that provide redundant and independent filtering mechanisms for each data type.	Content filtering is the process of inspecting information as it troverses a cross domain solution and determines if the information meets a pre-defined policy. Redundant and independent content filtering eliminates a single point of failure filtering system. Independence is defined as implementation of a content filter that uses a different code bose and supporting libraries (e.g., two JPEG filters using different vendors' JPEG libraries) and multiple, independent system processes.	
AC-4 (28)	2	Access Control Information Flow Enforcement Linear Filter Pipelines	When transferring information between different security or privacy domains, implement a linear content filter pipeline that is enforced with discretionary and mandatory access controls.	Content filtering is the process of inspecting information as it traverses a cross domain solution and determines if the information meets a pre-defined policy. The use of linear content filter in pielines ensures that filter processes are non-bypossable and always invoked. In general, the use of parallel filtering architectures for content filtering of a single data type introduces by-pass and non-invocation issues.	
AC-4 (29)	2	Access Control Information Flow Enforcement Filter Orchestration Engines	When transferring information between different security or privacy domains, employ content filter orchestration engines to ensure that: (a) Content filtering mechanism successfully complete execution without errors; and (b) Content filtering actions occur in the correct order and comply with [Assignment: organization-defined policy].	Content filtering is the process of inspecting information as it traverses a cross domain solution and determines if the information meets a pre-defined security policy and orchestrotion engine coordinates the sequencing of activities (manual and automated) in a content filtering process. Errors are defined as either anomalous actions or unexpected termination of the content filter process. This is not the same as a filter failing content due non-compliance with policy. Content filter reports are a commonly used mechanism to ensure expected filtering actions are completed successfully.	
AC-4 (30)	2	Access Control Information Flow Enforcement Filter Mechanisms Using Multiple Processes	When transferring information between different security or privacy domains, implement content filtering	The use of multiple processes to implement content filtering mechanisms reduces the likelihood of a single point of failure.	
AC-4 (31)	2	Access Control Information Flow Enforcement	mechanisms using multiple processes. When transferring information between different security or privacy domains, prevent the transfer of failed	Content that failed filtering checks, can corrupt the system if transferred to the receiving	
10.1(00)	_	Failed Content Transfer Prevention	content to the receiving domain.	domain.	
AC-4 (32)		Access Control Information Flow Enforcement Process Requirements for Information Transfer	When transferring information between different security or privacy domains, the process that transfers information between filter ippelines: (a) Does not filter message content; (b) Validates filtering metadata; (c) Ensures the content associated with the filtering metadata has successfully completed filtering; and (d) Transfers the content to the destination filter pipeline.	The processes transferring information between filter pipelines have minimum complexity and functionality to provide assurance that the processes operate correctly.	
AC-5	1	Access Control Separation of Duties	a. Identify and document [Assignment: organization-defined duties of individuals requiring separation]; and b. Define system access authorizations to support separation of duties.	Separation of duties addresses the potential for abuse of authorized privileges and helps to reduce the risk of malevolent activity without collusion. Separation of duties includes dividing mission or business functions and support functions among different individuals or roles; conducting system support functions with different individuals; and ensuring security personnel administering access control functions do not also administer audit functions. Because separation of duty violations can span systems and application domains, organizations consider the entirety of systems and system components when developing policy on separation of duties. This control is enforced through the account management activities in AC-2 and access control mechanisms in AC-3.	9, CM-5, CM-11, CP- 9, IA-2, IA-5, MA-3,
AC-6		Access Control Least Privilege	Employ the principle of least privilege, allowing only authorized accesses for users (or processes acting on behal of users) that are necessary to accomplish assigned organizational tasks.	privilege is also applied to system processes, ensuring that the processes have access to systems and operate at privilege levels no higher than necessary to accomplish organizational missions or business functions. Organizations consider the creation of additional processes, roles, and accounts as necessary, to achieve least privilege. Organizations apply least privilege to the development, implementation, and operation of organizational systems.	AC-2, AC-3, AC-5, AC- 16, CM-5, CM-11, Pi- 2, PM-12, SA-8, SA- 15, SA-17, SC-38
AC-6 (1)	2	Access Control Least Privilege Authorize Access to Security Functions	Explicitly authorize access for [Assignment: organization-defined individuals or roles] to: (a) [Assignment: organization-defined security functions (deployed in hardware, software, and firmware)]; and (b) [Assignment: organization-defined security-relevant information].	Security functions include establishing system accounts; configuring access authorizations (i.e., permissions, privileges), configuring settings for events to be audited, and establishing intrusion detection parameters. Security-relevant information includes filtering rules for routes or firewalls, configuration parameters for security services, cryptographic key management information, and access control lists. Explicitly authorized personnel include security administrators, system administrators, system security officers, system programmers, and other privileged users.	AC-17, AC-18, AC-19, AU-9, PE-2
AC-6 (2)	2	Access Control Least Privilege Non-privileged Access for Honsecurity Functions	Require that users of system accounts (or roles) with access to [Assignment: organization-defined security functions or security-relevant information], use non-privileged accounts or roles, when accessing nonsecurity functions.	Requiring use of non-privileged accounts when accessing nonsecurity functions limits exposure when operating from within privileged accounts or roles. The inclusion of roles addresses situations where arganizations implement access control policies such as role- based access control and where a change of role provides the same degree of assurance in the change of access authorizations for both the user and all processes acting on behalf of the user as would be provided by a change between a privileged and non-privileged account.	AC-17, AC-18, AC-19, PL-4

Control ID	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls	Notor
AC-6 (3)	2	Access Control Least Privilege Network Access to Privileged Commands	Authorize network access to [Assignment: organization-defined privileged commands] only for [Assignment: organization-defined compelling operational needs] and document the rationale for such access in the security jolan for the system.	Network access is any access across a network connection in lieu of local access (i.e., user being physically present at the device).	AC-17, AC-18, AC-19	Notes
AC-6 (4)		Access Control Least Privilege Separate Processing Domains	Provide separate processing domains to enable finer-grained allocation of user privileges.	machine while restricting privileges to other virtual machines or to the underlying physical machine; implementing separate physical domains, and employing hardware or software domain separation mechanisms.	AC-4, SC-2, SC-3, SC- 30, SC-32, SC-39	
AC-6 (5)	2	Access Control Least Privilege Privileged Accounts	Restrict privileged accounts on the system to [Assignment: organization-defined personnel or roles].	Privileged accounts, including super user accounts, are typically described as system administrator for various types of commercial off-the-shelf operating systems. Restricting privileged accounts to specific personnel or roles prevents day-to-day users from accessing privileged information or privileged functions. Organizations may differentiate in the application of this control enhancement between allowed privileges of local accounts and for domain accounts provided they retain the ability to control system configurations for key security parameters and as otherwise necessary to sufficiently mitigate risk.	IA-2, MA-3, MA-4	
AC-6 (6)		Access Control Leost Privilege Privileged Access by Non-organizational Users	Prohibit privileged access to the system by non-organizational users.	have the equivalent status of an employee. Organizational users include contractors, guest researchers, or individuals detailed from other organizations. A non-organizational user is a user who is not an organizational user. Policy and procedures for granting equivalent status of employees to individuals include a need-to-know, citizenship, and the relationship to the organization.		
AC-6 (7)	2	Access Control Least Privilege Review of User Privileges	(a) Review (Assignment: organization-defined frequency) the privileges assigned to (Assignment: organization-defined roles or classes of users) to validate the need for such privileges; and (b) Reassign or remove privileges, if necessary, to correctly reflect organizational mission and business needs.	The need for certain assigned user privileges may change over time reflecting changes in organizational missions and business functions, environments of operation, technologies, or threat. Periodic review of assigned user privileges is necessary to determine if the rationale for assigning such privileges remains valid. If the need cannot be revalidated, organizations take appropriate corrective actions.	CA-7	
AC-6 (8)	2	Access Control Leost Privilege Privilege Levels for Code Execution	Prevent the following software from executing at higher privilege levels than users executing the software: [Assignment: organization-defined software].	In certain situations, software applications or programs need to execute with elevated privileges to perform required functions. However, depending on the software functionality and configuration, if the privileges required for execution are at a higher level than the privileges assigned to organizational users invoking such applications or programs, those users may indirectly be provided with greater privileges than assigned.		
AC-6 (9)	2	Access Control Least Privilege Log Use of Privileged Functions	Audit the execution of privileged functions.	The misuse of privileged functions, either intentionally or unintentionally by authorized users, or by unauthorized external entities that have compromised system accounts, is a serious and ongoing concern and can have significant adverse impacts on organizations. Capturing the use of privileged functions in audit logs is one way to detect such misuse, and in doing so, help mitigate the risk from insider threats and the advanced persistent threat.	AU-2, AU-3, AU-12	
AC-6 (10)	2	Access Control Least Privilege Prohibit Non- privileged Users from Executing Privileged Functions	Prevent non-privileged users from executing privileged functions.	Privileged functions include disabling, circumventing, or altering implemented security or privacy controls; establishing system accounts; performing system integrity checks; and administering cryptographic key management activities. Non-privileged users are individuals that do not possess appropriate authorizations. Privileged functions that require protection from on-privileged uses include circumventing intusion detection and prevention mechanisms or malicious code protection mechanisms. This control enhancement is enforced by AC-3.		
AC-7	1	Access Control Unsuccessful Logon Attempts	a. Enforce a limit of [Assignment: organization-defined number] consecutive invalid logon attempts by a user during a [Assignment: organization-defined time-period]; and b. Automatically [Selection (one or more]: lock the account or node for an [Assignment: organization-defined time-period]; lock the account or node until released by an administrator; delay next logon prompt per [[Assignment: organization-defined delay algorithm]; notify system administrator; take other [Assignment: organization-defined delay algorithm]; notify system administrator; take other [Assignment: organization-defined action]] when the maximum number of unsuccessful attempts is exceeded.	This control applies regardless of whether the logon occurs via a local or network connection. Due to the potential for denial of service, automatic lockouts initiated by systems are usually temporary and automatically release after a predetermined, organization-defined time period. If a delay algorithm is selected, organizations may employ different algorithms for different components of the system based on the capabilities of those components. Responses to unsuccessful logon attempts may be implemented at the operating system and the application levels. Organization-defined actions that may be taken when the number of allowed consecutive invalid logon attempts is exceeded include prompting the user to answer a sceret question in addition to the username and password; invoking a lockdown mode with limited user capabilities (instead of full lockout); or comparing the IP address to all sits of known IP addresses for the user and then allowing additional logon attempts if the attempts are from a known IP address. Techniques to help prevent brute force attacks in leu of a automatic system lockout or the execution of delay algorithms support the objective of availability while still protecting against such attacks. Techniques that are effective when used in combination include prompting the user to respond to a scered question before the number of allowed unsuccessful logon attempts is exceeded; allowing users to logon only from specified IP addresses, exquiring a CAPTCHA to prevent automated attacks: or applying user profiles such as location, time of day, IP address, device, or MAC address. Automatically unlocking an account after a specified period of time is generally not permitted. However, exceptions may be required based on operational mission or need.	AC-2, AC-9, AU-2, AU-6, IA-5	
AC-7 (1)	2	Access Control Unsuccessful Logon Attempts X				[Withdrawn: Incorporated into AC-7.
AC-7 (2)	2	Automatic Account Lock Access Control Unsuccessful Logon Attempts Purge	Purge or wipe information from [Assignment: organization-defined mobile devices] based on [Assignment:	A mobile device is a computing device that has a small form factor such that it can be	AC-19. MP-5. MP-6	
	į	or Wipe Mobile Device	range or when injunction of prosping requirements and techniques of piter [Assignment: organization-defined number] consecutive, unsuccessful device logon attempts.	carried by a single individual; is designed to operate without a physical connection; possesses local, non-removable or removable data storage; and includes a self-contained power source. Purping or wiping the device applies only to mobile devices for which the organization-defined number of unsuccessful logans occurs. The logan is to the mobile device, not to any one account on the device. Successful logans to accounts on mobile devices reset the unsuccessful logan count to zero. Purging or wiping may be unnecessary if the information on the device is protected with sufficiently strong encryption mechanisms.	, <i>3,</i> 0	
AC-7 (3)	2	Access Control Unsuccessful Logon Attempts Biometric Attempt Limiting	Limit the number of unsuccessful biometric logon attempts to [Assignment: organization-defined number].	Biometrics are probabilistic in nature. The ability to successfully authenticate can be impacted by many factors, including matching performance and presentation attack detection mechanisms. Organizations select the appropriate number of attempts and fall back mechanisms for users based on organizationally-defined factors.	IA-3	

AC-7 (4)	Level 2	Access Control Unsuccessful Logon Attempts Use		Control Text a) Allow the use of [Assignment: organization-defined authentication factors] that are different from the	The use of alternate authentication factors supports the objective of availability and allows	IA-3	Notes
AC-7 (4)	2	of Alternate Factor	p h	u) milow the Ose (p) reasymment: organization-regime uduration-defined consecutive invalid logon attempts now been exceeded; and b) Francisco (p) organization-defined consecutive invalid logon attempts b) Enforce a limit of [Assignment: organization-defined number] consecutive invalid logon attempts through use [f the alternative factors by a user during a [Assignment: organization-defined time-period].	The use of unernate undernituding factors supports the dispective by availability and allows a user that has inadvertently been locked out to use additional authentication factors to bypass the lockout.	IX-3	
AC-8	1	Access Control System Use Notification	8 e 2 3 4 4 t c c t	Display (Assignment: organization-defined system use notification message or banner) to users before trainting access to the system that provides privacy not security notices consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines and state that: Users are accessing a U.S. Government system; System usage may be monitored, recorded, and subject to audit; Users of the system indicates consent to monitoring and recording; Use of the system indicates consent to monitoring and recording; Retain the notification message or banner on the screen until users acknowledge the usage conditions and ake explicit actions to log on to or further access the system; and Lefor publicly accessible systems: Display system use information (Assignment: organization-defined conditions), before granting further access or the publicly accessible system; Display references, if any, to monitoring, recording, or auditing that are consistent with privacy commodations for such systems that generally prohibit those activities; and I include a description of the authorized uses of the system.	System use notifications can be implemented using messages or warning banners displayed before individuals log in to systems. System use notifications are used only for access via logon interfaces with human users. Notifications are not required when human interfaces do not exist. Based on an assessment of risk, organizations consider whether or not a secondary system use notification is needed to access applications or other system resources after the initial network logon. Organizations consider system use notification messages or banners displayed in multiple languages based on organizational needs and the demographics of system users. Organizations also consult with the Office of the General Counsel for legal review and approval of warning banner content.	AC-14, PL-4, SI-4	
AC-9	1	Access Control Previous Logon Notification	N	Notify the user, upon successful logon to the system, of the date and time of the last logon.	Previous logon notification is applicable to system access via human user interfaces and access to systems that occurs in other types of architectures. Information about the last successful logon allows the user to recognize if the date and time provided is not consistent with the user's last access.	AC-7, PL-4	
AC-9 (1)	2	Access Control Previous Logon Notification Unsuccessful Logons	le	iotify the user, upon successful logon, of the number of unsuccessful logon attempts since the last successful agan.	Information about the number of unsuccessful logon attempts since the last successful logon allows the user to recognize if the number of unsuccessful logon attempts is consistent with the user's actual logon attempts.		
AC-9 (2)	2	Access Control Previous Logon Notification Successful and Unsuccessful Logons	a	iotify the user, upon successful logon, of the number of [Selection: successful logons; unsuccessful logon attempts; both] during [Assignment: organization-defined time-period].	Information about the number of successful and unsuccessful lagan attempts within a specified time period allows the user to recognize if the number and type of lagan attempts is consistent with the user's actual lagan attempts.		
AC-9 (3)	2	Access Control Previous Logon Notification Notification of Account Changes		Notify the user, upon successful logon, of changes to [Assignment: organization-defined security-related tharacteristics or parameters of the user's account] during [Assignment: organization-defined time-period].	Information about changes to security-related account characteristics within a specified time period allows users to recognize if changes were made without their knowledge.		
AC-9 (4)	2	Access Control Previous Logon Notification Additional Logon Information		volfy the user, upon successful logon, of the following additional information: (Assignment: organization- lefined additional information).	Organizations can specify additional information to be provided to users upon logon, including the location of last logan. User location is defined as that information which can be determined by systems, for example, Internet Protocol (IP) addresses from which network logons occurred, notifications of local logons, or device identifiers.		
AC-10	1	Access Control Concurrent Session Control		imit the number of concurrent sessions for each [Assignment: organization-defined account and/or account ype] to [Assignment: organization-defined number].	Organizations may define the maximum number of concurrent sessions for system accounts globally, by account type, by account, or any combination thereof. For example, organizations may limit the number of concurrent sessions for system administrators or other individuals working in particularly sensitive domains or mission-critical applications. This control addresses concurrent sessions for system accounts and does not address concurrent sessions by single users via multiple system accounts.	SC-23	
AC-11	1	Access Control Device Lock	s b	Prevent further access to the system by [Selection (one or more): initiating a device lock after [Assignment: urganization-defined time-period] of inactivity; requiring the user to initiate a device lock before leaving the system unattended); and Retain the device lock until the user reestablishes access using established identification and authentication procedures.	Device locks are temporary actions taken to prevent logical access to organizational systems when users stop work and move away from the immediate vicinity of those systems but do not want to log out because of the temporary nature of their absences. Device locks can be implemented at the operating system level or at the application level. A proximity lock may be used to initiate the device lock (e.g., via a Bluckoth-enabled device or dongle). User initiated device locking is behavior or policy-based and as such, requires users to take physical action to initiate the device lock. Device locks are not an acceptable substitute for logging out of systems, for example, if organizations require users to log out at the end of workdays.	AC-2, AC-7, IA-11, PL-4	
AC-11 (1)	2	Access Control Device Lock Pattern-hiding Displays	C	Conceal, via the device lock, information previously visible on the display with a publicly viewable image.	The pattern-hiding display can include static or dynamic images, for example, patterns used with screen savers, photographic images, solid colors, clock, battery life indicator, or a blank screen, with the caveat that controlled unclassified information is not displayed.		
AC-12		Access Control Session Termination	r	utomatically terminate a user session after [Assignment: organization-defined conditions or trigger events equiring session disconnect].	Session termination addresses the termination of user-initiated logical sessions (in contrast to SC-10, which addresses the termination of network connections associated with communications sessions (i.e., network disconnectly). A logical session (for local, network, and remote access) is initiated whenever a user (or process acting on behalf of a user) accesses an organizational system. Such user sessions can be terminated without terminating network sessions. Session termination ends all processes associated with a user's logical assion except those processes that are specifically recreated by the user (i.e., session owner) to continue after the session is terminated. Conditions or trigger events requiring automatic session termination include organization-defined periods of user inactivity, targeted responses to certain types of incidents, or time-of-day restrictions on system use.	MA-4, SC-10, SC-23	
AC-12 (1)	2	Access Control Session Termination User-initiated Logouts	a	provide a logout capability for user-initiated communications sessions whenever authentication is used to gain access to [Assignment: organization-defined information resources].	Information resources to which users gain access via authentication include local workstations, databases, and password-protected websites or web-based services.		
AC-12 (2)	2	Access Control Session Termination Termination Message	s	lisplay an explicit logout message to users indicating the termination of authenticated communications essions.	Lagout messages for web access can be displayed after authenticated sessions have been terminated. However, for certain types of sessions, including file transfer protocol (FTP) sessions, systems typically send lagout messages as final messages prior to terminating sessions.		
AC-12 (3)	2	Access Control Session Termination Timeout Warning Message	t	Display an explicit message to users indicating that the session will end in [Assignment: organization-defined ime until end of session].	To increase usability, notify users of pending session termination and prompt users to continue the session.

				d. Determine the permitted [Assignment: organization-defined values or ranges] for each of the established	system components. Attributes may be associated with active entities (i.e., subjects) that have the potential to send or receive information, to cause		
				attributes;	information to flow among objects, or to change the system state. These attributes may also be associated with passive entities (i.e., objects) that contain or receive information. The association of attributes to subject and objects by a system is referred to as binding and is inclusive of setting the attribute value and the attribute value. Extributes, when bound to data or information, permit		
				e. Audit changes to attributes; and	objects) that contain or receive information. The association of attributes to subjects and objects by a system is referred to as binding and is inclusive of setting the attribute value and the attribute type. Attributes, when bound to data or information, permit		
				f. Review [Assignment: organization-defined security and privacy attributes] for applicability [Assignment:	the enforcement of security and privacy policies for access control and information flow control, including data retention limits,		
				organization-defined frequency].	the enforcement of security and privacy policies for access control and information flow control, including data retention limits, permitted uses of personally identifiable information, and identification of personal information within data objects. Such enforcement occurs, through organizational processes or system incursions or mechanism. The binding tendiques implemented by systems affect the strength of attribute binding to information. Binding strength and the assurance associated with binding		
					systems affect the strength of attribute binding to information. Binding strength and the assurance associated with binding		
					techniques play an important part in the brust organizations have in the information flow enforcement process. The binding techniques affect the number and degree of additional reviews required by organizations. The content or assigned values of attributes can directly affect the ability of individuals to access organizational information.		
					attributes can directly affect the ability of individuals to access organizational information.		
					Organizations can define the types of attributes needed for systems to support missions or business functions. There are many values that can be assigned to a security attribute. Release markings include US only, NATO (North Atlantic Treaty Organization), or		
					NOFORN (not releasable to foreign nationals). By specifying the permitted attribute ranges and values, organizations ensure that attribute values are meaningful and relevant. Labeling refers to the association of attributes with the subjects and objects		
					act nature values are meaninguit ain the revenit. Labeling refers to the advantage of a continuous with the stages, and topics, and topics are represented by the internal data structures within systems. This facilitates system-based enforcement of information security and privacy policies. Labels include classification of information in accordance with legal and compliance requirements; access		
					privacy policies. Labels include classification of information in accordance with legal and compliance requirements; access authorizations; nationality; data life cycle protection (i.e., encryption and data expiration); personally identifiable information		
					autorizations; nationality; data are cycle protection (i.e., encryption and data expiration); personality identifiable information processing and affiliation as a contractor. Conversely, marking refers to the association of attributes with objects in a human-readable form. Marking enables manual,		
					Conversely, marking refers to the association of attributes with objects in a human-readable form. Marking enables manual,		
					procedural, or process-based enforcement of information security and privacy policies. Attribute types include classification level for objects and clearance (access authorization) level for subjects. An attribute value for both attribute types is Top Secret.		
AC-16 (1)	2	Access Control Security and Privacy Attributes		Dynamically associate security and privacy attributes with [Assignment: organization-defined subjects and	Dynamic association of attributes is appropriate whenever the security or privacy

AC-16 (8)	2	Access Control Security and Privacy Attributes	Implement [Assignment: organization-defined techniques and technologies] with [Assignment: organization-	The association of security and privacy attributes to information within systems is	MANAGE GOINTOIS	
		Association Techniques and Technologies	defined level of assurance] in associating security and privacy attributes to information.	important for conducting automated access enforcement and flow enforcement actions. The association of such attributes to information (i.e., binding) can be accomplished with		
				technologies and techniques providing different levels of assurance. For example, systems can bind attributes to information cryptographically using digital signatures supporting cryptographic keys protected by hardware devices (sometimes known as hardware roots of trust).		
AC-16 (9)	2	Access Control Security and Privacy Attributes Attribute Reassignment — Regrading Mechanisms	Change security and privacy attributes associated with information only via regrading mechanisms validated using [Assignment: organization-defined techniques or procedures].	trust). A regrading mechanism is a trusted process authorized to re-classify and re-label data in accordance with a defined policy exception. Validated regrading mechanisms are used by arganizations to provide the requisite levels of assurance for attribute reassignment activities. The validation is facilitated by ensuring that regarding mechanisms are single		
				purpose and of limited function. Since security and privacy attribute changes can directly affect policy enforcement actions, implementing trustworthy regrading mechanisms is necessary to help ensure that such mechanisms perform in a consistent and correct mode of operation.		
AC-16 (10)	2	Access Control Security and Privacy Attributes Attribute Configuration by Authorized Individuals	Provide authorized individuals the copability to define or change the type and value of security and privacy attributes available for association with subjects and objects.	The content or assigned values of security and privacy attributes can directly affect the ability of individuals to access organizational information. Therefore, it is important for systems to be able to limit the ability to create or modify attributes to authorized individuals only.		
AC-17	1	Access Control Remote Access	Establish and document usage restrictions, configuration/connection requirements, and implementation guidance for each type of remote access allowed; and b. Authorize each type of remote access to the system prior to allowing such connections.	Remote access is access to organizational systems (or processes acting on behalf of users) communicating through external networks such as the Internet. Types of remote access include dial-up, broadband, and wireless. Organizations use encrypted virtual private networks (VPNs) to enhance confidentiality and integrity for remote connections. The use of encrypted VPNs provides sufficient assurance to the organization that it can effectively treat such connections as internal networks if the cryptographic mechanisms used are implemented in accordance with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines. Still, VPN connections traverse external networks, and the encrypted VPN does not enhance the availability of remote connections. VPNs with encrypted tunnels can also affect the capability to adequately monitor network communications traffic for malicious code. Remote access controls apply to systems other than public web servers or systems designed for public access. This control addresses authorization prior to allowing remote access without specifying the specific formats for such authorization. While organizations may use information exchange and system connection security agreements to authorize remote access connections, such agreements are not required by this control. Enforcing access restrictions for remote access is addressed via AC-3.	AC-2, AC-3, AC-4, AC-1 3, CM-19, AC-1, AC-2, IA-3, IA-8, MA-4, PE-17, PL-2, PL-4, SC-10, S1-4	
AC-17 (1)	2	Access Control Remote Access Monitoring and Control	Employ automated mechanisms to monitor and control remote access methods.	Monitoring and control of remote access methods allows organizations to detect attacks and ensure compliance with remote access policies by auditing connection activities of remote users on a variety of system components, including servers, notebook computers, workstations, smort phones, and tablets. Audit lagging for remote access is enforced by AU- 2. Audit events are defined in AU-2a.	AU-2, AU-6, AU-12, AU-14	
AC-17 (2)	2	Access Control Remote Access Protection of Confidentiality and Integrity Using Encryption	Implement cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	Virtual private networks can be used to protect the confidentiality and integrity of remote access sessions. Transport Layer Security (TLS) is an example of a cryptographic protocol that provides end-to-end communications security over networks and is used for internet communications and aniline transactions.	SC-8, SC-12, SC-13	
AC-17 (3)	2	Access Control Remote Access Managed Access Control Points	Route remote accesses through authorized and managed network access control points.	Organizations consider the Trusted Internet Connections initiative [DHS TIC] requirements for external network connections since limiting the number of access control points for remote accesses reduces attack surface.	SC-7	
AC-17 (4)	2	Access Control Remote Access Privileged Commands and Access	(a) Authorize the execution of privileged commands and access to security-relevant information via remote access only in a format that provides assessable evidence and for the following needs: [Assignment: organization-defined needs]; and (b) Document the rationale for remote access in the security plan for the system.	Remote access to systems represents a significant potential vulnerability that can be exploited by adversaries. As such, restricting the execution of privileged commands and access to security-relevant information via remote access reduces the exposure of the organization and the susceptibility to threats by adversaries to the remote access capability.	AC-6, SC-12, SC-13	
AC-17 (5)	2	Access Control Remote Access Monitoring for X Unauthorized Connections				[Withdrawn: Incorporated into SI-4]
AC-17 (6)	2	Access Control Remote Access Protection of Mechanism Information	Protect information about remote access mechanisms from unauthorized use and disclasure.	Remote access to organizational information by nonorganizational entities can increase the risk of unauthorized use and disclosure about remote access mechanisms. The organization considers including remote access requirements in the information exchange agreements with other organizations, as applicable. Remote access requirements can also be included in rules of behavior (see PL-4) and access agreements (see PS-6).	AT-2, AT-3, PS-6	
AC-17 (7)	2	Access Control Remote Access Additional X Protection for Security Function Access				[Withdrawn: Incorporated into AC-3 (10)]
AC-17 (8)	2	Access Control Remote Access Disable Nonsecure X Network Protocols				[Withdrawn: Incorporated into CM-7]
AC-17 (9)	2	Access Control Remote Access Disconnect or Disable Access	Provide the capability to disconnect or disable remote access to the system within [Assignment: organization- defined time-period].	This control enhancement requires organizations to have the capability to rapidly disconnect current users remotely accessing the system or disable further remote access. The speed of disconnect or disablement varies based on the criticality of missions or business functions and the need to eliminate immediate or future remote access to systems.		
AC-17 (10)	2	Access Control Remote Access Authenticate Remote Commands	Implement [Assignment: organization-defined controls] to authenticate [Assignment: organization-defined remote commands].	Authenticating remote commands protects against unauthorized commands and the replay of authenticate remote commands. The capability to authenticate remote commands is important for remote systems whose loss, malfunction, misdirection, or exploitation would have immediate as serious consequences, including injury or death; property damage; loss of high value assets; failure of missions or business functions; or compromise of classified or controlled unclassified information. Authentication controls for remote commands ensure that systems accept and execute commands in the order intended, execute only authorized commands, and reject unauthorized commands. Authentication controls for emote commands and reject unauthorized commands. The properties of the second of the commands and reject unauthorized commands.	SC-12, SC-13, SC-23	
AC-18	1	Access Control Wireless Access	Establish configuration requirements, connection requirements, and implementation guidance for each type of wireless access; and Authorize each type of wireless access to the system prior to allowing such connections.	Wireless technologies include microwave, packet radio (ultra-high frequency or very high frequency), 802.11x, and Bluetooth. Wireless networks use authentication protocols that provide credential protection and mutual authentication.	AC-2, AC-3, AC-17, AC 19, CA-9, CM-7, IA-2, IA-3, IA-8, PL-4, SC- 40, SC-43, SI-4	
AC-18 (1)	2	Access Control Wireless Access Authentication and Encryption	Protect wireless access to the system using authentication of [Selection (one or more): users; devices] and encryption.	Wireless networking capabilities represent a significant potential vulnerability that can be exploited by adversaries. To protect systems with wireless access points, strong authentication of users and devices with encryption can reduce susceptibility to threats by adversaries involving wireless technologies.	SC-8, SC-13	
AC-18 (2)	2	Access Control Wireless Access Monitoring X Unauthorized Connections				[Withdrawn: Incorporated into SI-4]

Control ID	Lovel	Control Name	Withdrawn	Control Toy	Discussion	Palated Controls	Notes
Control ID AC-20	tevel 1	Control Name Access Control Use of External Systems		Control Toxt Establish [Selection (one or more): [Assignment: organization-defined terms and conditions]; [Assignment: organization-defined controls asserted to be implemented on external systems]], consistent with the trust relationships established with other organizations owning, operating, and/or maintaining external systems, allowing authorized individuals to: a. Access the system from external systems; and b. Process, store, or transmit organization-controlled information using external systems.	Discussion External systems are systems that are used by, but not a part of, organizational systems and for which the organization has no direct control over the implementation of required security and privacy controls or the assessment of control effectiveness. External systems include personally owned systems, components, or devices, privately owned computing and communications devices in commercial or public facilities, systems owned or controlled by nonfederal organizations, systems managed by contractors, and federal information systems that are not owned by, operated by, or under the direct supervision and authority of the organization. External systems also include systems owned or operated by other components within the same organization, and systems within the organization with different authorization boundaries. For some external systems (i.e., systems operated by other organizations), the trust relationships that have been established between organizations and the originating organization may be such, that no explicit terms and conditions are required, systems within these organizations may not be considered external. These situations occur when, for example, there are pre-existing information exchange agreements (either implicit or explicit) established between organizations may not be considered external. These situations occur when, for example, there are pre-existing information exchange agreements (either implicit or explicit) established between organizations or when such agreements are specified by applicable laws, executive orders, directives, regulations, or when such agreements are specified by applicable laws, executive orders, directives, regulations, or when such agreements are specified by applicable laws, executive orders, directives, regulations, or when such agreements are specified by applicable laws, executive orders, directives, regulations have the understand systems of the such as a such as a substance of the such as a	Related Controls AC-2, AC-3, AC-17, AC- 19, CA-3, Pt-2, Pt-4, SA-9, SC-7	Notes
AC-20 (1)	2	Access Control Use of External Systems Limits on Authorized Use		Permit authorized individuals to use an external system to access the system or to process, store, or transmit organization-controlled information only after: (a) Verification of the implementation of controls on the external system as specified in the organization's security and privacy policies and security and privacy plans; or (b) Retention of approved system connection or processing agreements with the organizational entity hosting the external system.	limits on authorized use recognizes the circumstances where individuals using external systems may need to access organizational systems. Organizations need assurance that the external systems contain the necessary controls so as not to compromise, damage, or otherwise harm organizational systems. Verification that the required controls have been implemented con be achieved by external, independent assessments, attestations, or other means, depending on the confidence level required by organizations.	CA-2	
AC-20 (2)	2	Access Control Use of External Systems Portable Storage Devices — Restricted Use		Restrict the use of organization-controlled portable storage devices by authorized individuals on external systems using [Assignment: organization-defined restrictions].	Limits on the use of organization-controlled portable storage devices in external systems include restrictions on how the devices may be used and under what conditions the devices may be used.	MP-7, SC-41	
AC-20 (3)	2	Access Control Use of External Systems Non- organizationally Owned Systems — Restricted Use		Restrict the use of non-organizationally owned systems or system components to process, store, or transmit organizational information using [Assignment: organization-defined restrictions].	Non-organizationally owned systems or system components include systems or system components owned by other organizations and personally owned devices. There are potential risks to using non-organizationally owned systems or system components. In some cases, the risk is sufficiently high as to prohibit such use (see Ac-20(6)). In other cases, the use of such systems or system components may be ellowed but restricted in some woy. Restrictions include requiring the implementation of approved controls prior to authorizing connection of non-organizationally owned systems and components; limiting access to types of information, services, or applications, using virtualization techniques to limit processing and storage activities to servers or system components provisioned by the organization; and agreeing to the terms and conditions for usage. Organizations consult with the Office of the General Counsel regarding legal issues associated with using personally owned devices, including requirements for conducting forensic analyses during investigations after an incident.		
AC-20 (4)	2	Access Control Use of External Systems Network		Prohibit the use of [Assignment: organization-defined network accessible storage devices] in external systems.	Network accessible storage devices in external systems include online storage devices in		
AC-20 (5)	2	Accessible Storage Devices Access Control Use of External Systems Portable		Prohibit the use of organization-controlled portable storage devices by authorized individuals on external	public, hybrid, or community cloud-based systems. Limits on the use of organization-controlled portable storage devices in external systems	MP-7, SC-41	
AC-20 (6)		Storage Devices — Prohibited Use Access Control J. Use of External Systems Non- organizationally Owned Systems — Prohibited Use		systems. Prohibit the use of non-organizationally owned systems or system components to process, store, or transmit organizational information.	Include a complete prohibition of the use of such devices. Non-organizationally owned systems or system components include systems or system components owned by other organizations and personally owned devices. There are potential risks to using non-organizationally owned systems or system components. In some cases, the risk is sufficiently high as to prohibit such use. In other cases, the use of such systems or system components may be allowed but restricted in some way (see AC-20(4)).		
AC-21		Access Control Information Sharing		a. Enable authorized users to determine whether access authorizations assigned to a sharing partner match the information's access and use restrictions for [Assignment: organization-defined information sharing circumstances where user discretion is required]; and b. Employ [Assignment: organization-defined authorization and processes] to assist users in making information sharing and collaboration decisions.	some formal or administrative determination. Examples of such information include, contract-sensitive information, classified information related to special access programs or compartments, privileged information, proprietary information, and personally identifiable information. Security and privacy risk assessments as well as applicable laws, regulations, and policies can provide useful injust to these determinations. Deepending on the circumstances, sharing partners may be defined at the individual, group, or organizational level. Information may be defined by content, type, security category, or special access program or compartment. Access restrictions may include non-disclosure agreements (NDA).	AC-3, AC-4, AC-16, PT- 2, PT-8, RA-3, SC-15	
AC-21 (1)	2	Access Control Information Sharing Automated Decision Support		Employ [Assignment: organization-defined automated mechanisms] to enforce information-sharing decisions by authorized users based on access authorizations of sharing partners and access restrictions on information to be shared.	Automated mechanisms are used to enforce information sharing decisions.		
AC-21 (2)	2	Access Control Information Sharing Information Search and Retrieval		Implement information search and retrieval services that enforce [Assignment: organization-defined information sharing restrictions].	Information search and retrieval services identify information system resources relevant to an information need.		
AC-22	1	Access Control Publicly Accessible Content		a. Designate individuals authorized to make information publicly accessible; b. Train authorized individuals to ensure that publicly accessible information does not contain nonpublic information; c. Review the proposed content of information prior to posting onto the publicly accessible system to ensure that nonpublic information is not included; and d. Review the content on the publicly accessible system for nonpublic information [Assignment: organization-defined frequency] and remove such information, if discovered.	In injuriation need. In accordance with applicable laws, executive orders, directives, policies, regulations, standards, and guidelines, the public is not authorized to have access to nonpublic information, including information protected under the IPRIVACTI and proprietary information. This control addresses systems that are controlled by the organization and accessible to the public, typically without identification or authentication. Positive information on non-organizational systems (e.g., non-organizational public websites, forums, and social media) is covered by organizational policy. While organizations may have individuals who are responsible for developing and implementing policies about the information that can be made publicly accessible, this control addresses the management of the individuals who make such information publicly accessible.	AC-3, AT-2, AT-3, AU- 13

AC-23	1	Control Name Access Control Data Mining Protection		Control Text Employ [Assignment: organization-defined data mining prevention and detection techniques] for [Assignment: organization-defined data storage objects] to detect and protect against unauthorized data mining.	Discussion Data mining is an analytical process that attempts to find correlations or patterns in large data sets for the purpose of data or knowledge discovery. Data storage objects include database records and database fields. Sensitive information can be extracted from data mining operations. When information is personally identifiable information, it may lead to unanticipated revelations about individuals and give rise to privacy risks. Prior to performing data mining activities, organizations determine whether such activities are authorized. Organizations may be subject to applicable laws, executive orders, directives, regulations, or policies that address data mining requirements. Organizational personnel consult with the senior agency official for privacy and legal counsel regarding such requirements. Data mining prevention and detection techniques include limiting the number and the frequency of database queries to increase the work factor needed to determine the contents of such database; limiting types of responses provided to database queries; applying differential privacy techniques or homomorphic encryption; and notifying personnel when atypical database queries or accesses occur. Data mining protection focuses on protecting information from data mining while such information resides in organizational data stores. In contrast, AU-13 focuses on monitoring for organizational information that may have been mined or otherwise obtained from data stores and is available as open source information residing on external sites, for example, through social networking or social media websites. [E0 13587] requires the establishment of an insider threat program for deterring, detecting, and mitigating insider threats, including the safeguarding of sensitive information from exploration, compromise, or other unauthorized disclosure. This control requires organizations to identify appropriate techniques to prevent and detect unnecessary or unauthorized data mining, which can be used by an insider to collect org	Related Controls PM-12, PT-2	NO.
AC-24	1	Access Control Access Control Decisions		[Selection: Establish procedures; Implement mechanisms] to ensure [Assignment: organization-defined access control decisions] are applied to each access request prior to access enforcement.	Access control decisions (also known as authorization decisions) occur when authorization information is applied to specific accesses. In contrast, accesses informement occurs when systems enforce access control decisions. While it is very common to have access control decisions and access enforcement implemented by the same entity, it is not required, and it is not always an optimal implementation choice. For some architectures and distributed systems, different entities may perform access control decisions and access enforcement.	AC-2, AC-3	
AC-24 (1)	2	Access Control Access Control Decisions Transmit Access Authorization Information		Transmit [Assignment: organization-defined access authorization information] using [Assignment: organization- defined controls] to [Assignment: organization-defined systems] that enforce access control decisions.	Authorization processes and access control decisions may occur in separate parts of systems or in separate systems. In such instances, outhorization information is transmitted securely (e.g., using crybtographic mechanisms) so timely excess control decisions can be enforced at the appropriate locations. To support the access control decisions, it may be necessary to transmit as part of the access authorization information, supporting security and privacy attributes. This is because in distributed systems, there are various occess control decisions that need to be made and different entities make these decisions in a serial fashion, each requiring those attributes to make the decisions. Protecting access authorization information ensures that such information cannot be altered, spoofed, or compromised during transmission.	AU-10	
AC-24 (2)	2	Access Control Access Control Decisions No User or Process Identity		Enforce access control decisions based on [Assignment: organization-defined security or privacy attributes] that do not include the identity of the user or process acting on behalf of the user.	In certain situations, it is important that access control decisions can be made without information regarding the identity of the users issuing the requests. These are generally instances where preserving individual privacy is of paramount importance. In other situations, user identification information is simply not needed for access control decision and, especially in the case of distributed systems, transmitting such information with the needed degree of assurance may be very expensive or difficult to accomplish. MAC, RBAC, ABAC, and label-based control policies, for example, might not include user identity as an attribute.		
AC-25		Access Control Reference Monitor		Implement a reference monitor for [Assignment: organization-defined access control policies] that is tamperproof, always invoked, and small enough to be subject to analysis and testing, the completeness of which can be assured.	that as key component of an operating system, enforces an access control policy over all	AC-3, AC-16, SA-8, SA 17, SC-3, SC-11, SC- 39, SI-13	
AT	0	Awareness and Training					
AT-1	1	Awareness and Training Policy and Procedures		a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]. I. [Selection (no or more): organization-level; mission/business process-level; system-level] awareness and training policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the awareness and training policy and the associated awareness and training to represent the awareness and training to the swareness and training to be separated in the system of the awareness and training to the swareness and training to the swareness and training to the swareness and training to a policy and procedures; and 6. Review and update the current awareness and training: 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the AT family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and privacy assurance. Therefore, it is important that security and privacy programs collaborate on their development. Security and privacy programs policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures acts with the sesticies how the policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures sective how the policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in systems security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.	PM-9, PS-8, SI-12	

Control ID AT-2	Level 1	Control Name Awareness and Training Awareness Training	Control Test a. Provide security and privacy awareness training to system users (including managers, senior executives, and contractors): 1. As part of initial training for new users and [Assignment: organization-defined frequency] thereafter; and 2. When required by system changes; and b. Update awareness training [Assignment: organization-defined frequency].		4, IR-2, IR-7, IR-9, PL- 4, PM-13, PM-21, PS-	Notes
AT-2 (1)	2	Awareness and Training Awareness Training Practical Exercises	Provide practical exercises in awareness training that simulate events and incidents.	Practical exercises include no-notice social engineering attempts to collect information, gain unauthorized access, or simulate the adverse impact of opening malicious email attachments; or invoking, via spear phishing attacks, malicious web links.	CA-2, CA-7, CP-4, IR- 3	
AT-2 (2)	2	Awareness and Training Awareness Training Insider Threat	Provide awareness training on recognizing and reporting potential indicators of insider threat.	Potential indicators and possible precursors of insider threat can include behaviors such as inordinate, long-term job dissatisfaction, ottempts to gain access to information not required for job performance; unexplained access to financial resources; bullying or sexual harassment of fellow employees; workplace violence; and other serious violations of podicies, procedures, directives, requalations, rules, or practices. Awareness training includes how to communicate concerns of employees and management regarding potential indicators of insider threat through channels established by the organization and in accordance with established polities and pracedures. Organizations may consider tailoring insider threat toworeness topics to the role. For example, training for managers may be focused on changes in behavior of team members, while training for employees may be focused on of nanges in behavior of team members, while training for employees may be focused on more general observations.	PM-12	
AT-2 (3)	2	Awareness and Training Awareness Training Social Engineering and Mining	Provide awareness training on recognizing and reporting potential and actual instances of social engineering and social mining.	Social engineering is an attempt to trick an individual into revealing information or taking an action that can be used to breach, compromise, or otherwise adversely impact a system. Social engineering includes phishing, pretexting, impersonation, boiling, quid pro quo, thread-jacking, social media exploitation, and taligating. Social mining is an attempt to anther information about the arganization that may be used to support future attacks. Awareness training includes information on how to communicate the concerns of employees and management regarding potential and actual instances of social engineering and data mining through organizational channels based on established policies and procedures.		
AT-2 (4)	2	Awareness and Training Awareness Training Suspicious Communications and Anomalous System Behavior	Provide awareness training on recognizing suspicious communications and anomalous behavior in organizational systems using [Assignment: organization-defined indicators of malicious code].	A well-trained workforce provides another organizational control that can be employed as part of a defense-in-depth strategy to protect organizations against malicious code coming into organizations via email or the web applications. Personnel are trained to look for indications of potentially suspicious email (e.g., receiving an unexpected email, receiving an indications of potentially suspicious email (e.g., receiving an email from a unifamiliar sender but who appears to be from a known sponsor or contractor). Personnel are also trained on how to respond to suspicious email or web communications. For this process to work effectively, personnel are trained and made aware of what constitutes suspicious communications. Training personnel on how to recognize anomalous behaviors in systems can provide organizations with early warming for the presence of malicious code. Recognition of anomalous behaviors by organizational personnel can supplement malicious code detection and protection tools and systems employed by organizations.		
AT-2 (5)	2	Awareness and Training Awareness Training Breach	Provide awareness training on how to identify and respond to a breach, including the organization's process for reporting a breach.	A breach is a type of incident that involves personally identifiable information. A breach results in the loss of control, compromise, unauthorized disclosure, unauthorized acquisition, or a similar occurrence where a person other than an authorized user accesses or potentially accesses personally identifiable information or an authorized user accesses or potentially accesses such information for other than authorized purposes. The awareness training emphasizes the obligation of individuals to report bath confirmed and suspected breaches involving information in any medium or form, including paper, oral, and electronic. Awareness training includes tabletop exercises that simulate a breach.	IR-1, IR-2	
AT-2 (6)	2	Awareness and Training Awareness Training Advanced Persistent Threat	Provide awareness training on the advanced persistent threat.	An effective way to detect advanced persistent threats (APT) and to preclude success attacks its oprovide specific awareness training for individuals. Threat awareness training includes educating individuals on the various ways APTs can inflittate into the organization (i.e.g., through websites, emails, advertisement pop-ups, articles, and social engineering). Effective training includes techniques for recognitive suspicious emails, use of removable systems in non-secure settings, and the potential targeting of individuals at home.		
AT-2 (7)	2	Awareness and Training Awareness Training Cyber Threat Environment	(a) Provide awareness training on the cyber threat environment; and (b) Reflect current cyber threat information in system operations.	Since threats continue to change over time, the threat awareness training by the organization is dynamic. Moreover, threat awareness training is not performed in isolation from the system operations that support organizational missions and business functions.	RA-3	
AT-2 (8)	2	Awareness and Training Awareness Training Training Feedback	Provide feedback on organizational training results to the following personnel [Assignment: organization- defined frequency]: [Assignment: organization-defined personnel].	Training feedback includes awareness training results and role-based training results. Training results, especially failures of personnel in critical roles, can be indicative of a potentially serious problem. Therefore, it is important that senior managers are made aware of such situations so that they can take appropriate response actions. Training feedback supports the assessment and update of organization training described in AT-2b.

Control ID		Control Name Audit and Accountability Event Logging	Withdrawn	Control Text a. Identify the types of events that the system is capable of logging in support of the audit function: [Assignment]	An event is an observable occurrence in a system. The types of events that require logging are those	AC-2, AC-3, AC-6, AC-	Notes
[""	-	Lacint Togging		organization-defined event types that the system is capable of logging1:	events that are significant and relevant to the security of systems and the privacy of individuals.	7, AC-8, AC-16, AC-	
				b. Coordinate the event logging function with other organizational entities requiring audit-related information to	Event logging also supports specific monitoring and auditing needs. Event types include password changes; failed logons or failed accesses related to systems; security or privacy attribute changes;	17, AU-3, AU-4, AU-5,	
				guide and inform the selection criteria for events to be logged;	administration and description of the DRA and anticolors and the Association and the A	AU-6, AU-7, AU-11,	
				c. Specify the following event types for logging within the system: [Assignment: organization-defined event types (subset of the event types defined in AU-2 a.) along with the frequency of (or situation requiring) logging for	external credential usage. In determining the set of event types that require logging, organizations	AU-12, CM-3, CM-5, CM-6, CM-13, IA-3,	
				each identified event type];	consider the monitoring and auditing appropriate for each of the controls to be implemented. For completeness, event logging includes all protocols that are operational and supported by the system.	MA-4, MP-4, PE-3,	
				d. Provide a rationale for why the event types selected for logging are deemed to be adequate to support after-	To balance monitoring and auditing requirements with other system needs, this control also requires	PM-21, PT-2, PT-8,	
				the-fact investigations of incidents; and	identifying the subset of event types that are logged at a given point in time. For example,	RA-8, SA-8, SC-7, SC-	
				e. Review and update the event types selected for logging [Assignment: organization-defined frequency].	organizations may determine that systems need the capability to log every file access successful and unsuccessful, but not activate that capability except for specific circumstances due to the potential	18, SI-3, SI-4, SI-7, SI- 10, SI-11	
					burden on system performance. The types of events that organizations desire to be logged may	10, 31 11	
					change. Reviewing and updating the set of logged events is necessary to help ensure that the events		
					remain relevant and continue to support the needs of the organization. Organizations consider how the types of logging events can reveal information about individuals that may give rise to privacy risk		
					and how best to mitigate such risks. For example, there is the potential for personally identifiable		
					information in the audit trail especially if the logging event is based on patterns or time of usage. Event logging requirements, including the need to log specific event types, may be referenced in		
					other controls and control enhancements. These include AC-2(4), AC-3(10), AC-6(9), AC-16(11), AC-		
					17(1), CM-3.f, CM-5(1), IA-3(3.b), MA-4(1), MP-4(2), PE-3, PM-21, PT-8, RA-8, SC-7(9), SC-7(15), SI-3(8), SI-4(22), SI-7(8), and SI-10(1). Organizations include event types that are required by applicable		
					laws, executive orders, directives, policies, regulations, standards, and guidelines. Audit records can		
					be generated at various levels, including at the packet level as information traverses the network.		
					Selecting the appropriate level of event logging is an important part of a monitoring and auditing capability and can identify the root causes of problems. Organizations consider in the definition of		
					event types, the logging necessary to cover related event types such as the steps in distributed,		
					transaction-based processes and the actions that occur in service-oriented architectures.		
AU-2 (1)	2	Audit and Accountability Event Logging Compilation of Audit Records from Multiple Sources	Х				[Withdrawn: Incorporated into AU-12]
AU-2 (2)	2	Audit and Accountability Event Logging Selection	Х				[Withdrawn: Incorporated into AU-12]

AU-3	1	Audit and Accountability Content of Audit Records		Ensure that audit records contain information that establishes the following:	Audit record content that may be necessary to support the auditing function includes, but is	AU-2, AU-8. AU-12	
		,,		a. What type of event occurred;	not limited to, event descriptions (item a), time stamps (item b), source and destination	AU-14, MA-4, SA-8, SI	
				b. When the event occurred;	addresses (item c), user or process identifiers (items d and f), success or fail indications	7, SI-11	
				c. Where the event occurred; d. Source of the event;	(item e), and filenames involved (items a, c, e, and f). Event outcomes include indicators of event success or failure and event-specific results, such as the system security and privacy		
				e. Outcome of the event; and	posture after the event occurred. Organizations consider how audit records can reveal		
				f. Identity of any individuals, subjects, or objects/entities associated with the event.	information about individuals that may give rise to privacy risk and how best to mitigate		
					such risks. For example, there is the potential for personally identifiable information in the		
					audit trail especially if the trail records inputs or is based on patterns or time of usage.		
AU-3 (1)	2	Audit and Accountability Content of Audit Records Additional Audit Information		Generate audit records containing the following additional information: [Assignment: organization-defined additional information].	The ability to add information generated in audit records is dependent on system functionality to configure the audit record content. Organizations may consider additional		
		Traditional Fladit Injoirnation		additional injurisdicing.	information in audit records including, but not limited to, access control or flow control rules		
					invoked and individual identities of group account users. Organizations may also consider		
					limiting additional audit record information to only information explicitly needed for audit requirements. This facilitates the use of audit trails and audit logs by not including		
					information in audit records that could potentially be misleading or that could make it more		
					difficult to locate information of interest.		
AU-3 (2)	2	Audit and Accountability Content of Audit Records		Provide centralized management and configuration of the content to be captured in audit records generated by	Centralized management of planned audit record content requires that the content to be	AU-6, AU-7	
5 (2)	-	Centralized Management of Planned Audit Record		[Assignment: organization-defined system components].	captured in audit records be configured from a central location (necessitating an	,	
		Content			automated capability). Organizations coordinate the selection of the required audit record		
					content to support the centralized management and configuration capability provided by the system.		
AU-3 (3)	2	Audit and Accountability Content of Audit Records		Limit personally identifiable information contained in audit records to the following elements identified in the	Limiting personally identifiable information in audit records when such information is not	RA-3	
		Limit Personally Identifiable Information Elements		privacy risk assessment: [Assignment: organization-defined elements].	needed for operational purposes helps reduce the level of privacy risk created by a system.		
AU-4	1	Audit and Accountability Audit Log Storage Capacity		Allocate audit log storage capacity to accommodate [Assignment: organization-defined audit log retention	Organizations consider the types of audit logging to be performed and the audit log	AU-2, AU-5, AU-6, AU	
				requirements].	processing requirements when allocating audit log storage capacity. Allocating sufficient audit log storage capacity reduces the likelihood of such capacity being exceeded and	7, AU-9, AU-11, AU- 12, AU-14, SI-4	
					resulting in the potential loss or reduction of audit logging capability.	, , , , , , , , , , , , , , , , , , ,	
AU-4 (1)	2	Audit and Accountability Audit Log Storage Capacity Transfer to Alternate Storage		Transfer audit logs [Assignment: organization-defined frequency] to a different system, system component, or media other than the system or system component conducting the logging.	Audit log transfer, also known as off-loading, is a common process in systems with limited audit log storage capacity and thus supports availability of the audit logs. The initial audit		
		, manager to Attendate storage		means outer than the system of system component conducting the logging.	log storage is used only in a transitory fashion until the system can communicate with the		
					secondary or alternate system allocated to audit log storage, at which point the audit logs		
					are transferred. This control enhancement is similar to AU-9(2) in that audit logs are		
					transferred to a different entity. However, the primary purpose of selecting AU-9(2) is to protect the confidentiality and integrity of audit records. Organizations can select either		
					control enhancement to obtain the dual benefit of increased audit log storage capacity and		
					preserving the confidentiality, integrity, and availability of audit records and logs.		
AU-5	1	Audit and Accountability Response to Audit Logging		a. Alert [Assignment: organization-defined personnel or roles] within [Assignment: organization-defined time-	Audit logging process failures include, for example, software and hardware errors; reaching	AU-2, AU-4. AU-7. AU	
	-	Process Failures		period] in the event of an audit logging process failure; and	or exceeding audit log storage capacity; and failures in audit log capturing mechanisms.	9, AU-11, AU-12, AU-	
				b. Take the following additional actions: [Assignment: organization-defined additional actions].		14, SI-4, SI-12	
					system; and stopping the generation of audit records. Organizations may choose to define additional actions for audit logging process failures based on the type of failure, the location		
					of the failure, the severity of the failure, or a combination of such factors. When the audit		
					logging process failure is related to storage, the response is carried out for the audit log		
					storage repository (i.e., the distinct system component where the audit logs are stored);		
					the system on which the audit logs reside; the total audit log storage capacity of the organization (i.e., all audit log storage repositories combined), or all three. Organizations		
					the system on which the audit logs reside; the total audit log storage capacity of the organization (i.e., all audit log storage repositories combined), or all three. Organizations may decide to take no additional actions after alerting designated roles or personnel.		
					organization (i.e., all audit log storage repositories combined), or all three. Organizations		

Control ID	Level	Control Name Withdrawn	Control Text	Planata	Related Controls	Notes
AU-5 (1)	zevel 2	Audit and Accountability Response to Audit Logging	Provide a warning to [Assignment: organization-defined personnel, roles, and/or locations] within [Assignment:	Organizations may have multiple audit log storage repositories distributed across multiple	Related Controls	Notes
AU-3 (1)	2	Process Failures Storage Capacity Warning	rrowne a warming to presignment, organization-regined personner, rote, and/or accusions within presignment, organization-defined time-period) when allocated audit log storage volume reaches [Assignment: organization- defined percentage] of repository maximum audit log storage capacity.	system components, with each repository having different storage volume capacities.		
AU-5 (2)		Audit and Accountability Response to Audit Logging Process Failures Real-time Alerts	Provide an olert within [Assignment: organization-defined real-time-period] to [Assignment: organization- defined personnel, roles, and/or locations) when the following audit failure events occur: [Assignment: organization-defined audit logging failure events requiring real-time alerts].	Alerts provide organizations with urgent messages. Real-time alerts provide these messages at information technology speed (i.e., the time from event detection to alert occurs in seconds or less).		
AU-5 (3)	2	Audit and Accountability Response to Audit Logging Process Fallures Configurable Traffic Volume Thresholds	Enforce configurable network communications traffic volume thresholds reflecting limits on audit log storage capacity and [Selection: reject; delay] network traffic above those thresholds.	Organizations have the capability to reject or delay the processing of network communications traffic if audit logging information about such traffic is determined to exceed the storage capacity of the system audit logging function. The rejection or delay response is triggered by the established organizational traffic volume thresholds that can be adjusted based on changes to audit log storage capacity.		
AU-5 (4)	2	Audit and Accountability Response to Audit Lagging Process Fallures Shutdown on Fallure	Invoke a [Selection: full system shutdown; partial system shutdown; degraded operational mode with limited mission or business functionality available] in the event of [Assignment: organization-defined audit logging failures], unless an alternate audit logging capability exists.	Organizations determine the types of outfit logging follures that can trigger outsmatic system shutdowns or degraded operations. Because of the importance of ensuring mission and business continuity, organizations may determine that the nature of the oudfit logging follure is not so sewere that it warrants a complete shutdown of the system supporting the core organizational missions and business operations. In those instances, partial system shutdowns or operating in a degraded mode with reduced capability may be viable alternatives.	AU-15	
AU-5 (5)	2	Audit and Accountability Response to Audit Logging Process Failures Alternate Audit Logging Capability	Provide an alternate audit logging capability in the event of a failure in primary audit logging capability that implements [Assignment: organization-defined alternate audit logging functionality].	Since an alternate audit logging capability may be a short-term protection solution employed until the failure in the primary audit logging capability is corrected, organizations may determine that the alternate audit logging capability need only provide a subset of the primary audit logging functionality that is impacted by the failure.	AU-9	
AU-6	1	Audit and Accountability Audit Record Review, Analysis, and Reporting	a. Review and analyze system audit records [Assignment: organization-defined frequency] for indications of [Assignment: organization-defined inappropriate or unusual activity]; b. Report Indings to [Assignment: organization-defined pend or roles]; and c. Adjust the level of audit record review, analysis, and reporting within the system when there is a change in risk based on law enforcement information, intelligence information, or other credible sources of information.	Audit record review, analysis, and reporting covers information security- and privacy- related logging performed by organizations, including logging that results from monitoring of account usage, remote access, wireless connectivity, mobile device connection, configuration settings, system component inventory, use of maintenance tools and nonlocal maintenance, physical access, temperature and humidity, equipment delivery and removal, communications at system boundaries, and use of mobile code or VoIP. Findings can be reported to organizational entities that include the incident response team, help desk, and security or privacy offices. If organizations are prohibited from reviewing and analyzing audit records or unable to conduct such activities, the review or analysis may be carried out by other organizations granted such authority. The frequency, scope, and/or depth of the audit record review, analysis, and reporting may be adjusted to meet organizational needs based on new information received.	CM-10, CM-11, IA-2, IA-3, IA-5, IA-8, IR-5, MA-4, MP-4, PE-3, PE 6, RA-5, SA-8, SC-7, SI	
AU-6 (1)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Automated Process Integration	Integrate audit record review, analysis, and reporting processes using [Assignment: organization-defined automated mechanisms].	Organizational processes benefiting from integrated audit record review, analysis, and reporting include incident response, continuous monitoring, contingency planning, investigation and response to suspicious activities, and Inspector General audits.	PM-7	
AU-6 (2)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Automated Security Alerts				[Withdrawn: Incorporated into SI-4]
AU-6 (3)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Correlate Audit Record Repositories	Analyze and correlate audit records across different repositories to gain organization-wide situational awareness.	Organization-wide situational awareness includes awareness across all three levels of risk management (i.e., organizational level, mission/business process level, and information system level) and supports cross-organization awareness.	AU-12, IR-4	
AU-6 (4)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Central Review and Analysis	Provide and implement the capability to centrally review and analyze audit records from multiple components within the system.	Automated mechanisms for centralized reviews and analyses include Security Information and Event Management products.	AU-2, AU-12	
AU-6 (5)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Integrated Analysis of Audit Records	Integrate analysis of audit records with analysis of [Selection (one or more): vulnerability scanning information; performance data; system monitoring information; [Assignment: organization-defined data/information collected from other sources]] to further enhance the ability to identify inappropriate or unusual activity.	Integrated analysis of audit records does not require vulnerability scanning, the generation of performance data, or system monitoring, Rather, integrated analysis requires that the analysis of information generated by scanning, monitoring, or other data collection activities is integrated with the analysis of audit record information. Security information and Event Management tools can facilitate audit record aggregation or consolidation from multiple system components as well as audit record correlation and analysis. The use of standardized audit record analysis scripts developed by organizations (with localized script adjustments, as necessary) provides more cost-effective approaches for analyzing audit record information collected. The correlation of audit record information with vulnerability scanning information is important in determining the venecty of vulnerability scans constraints of the system and in correlating attack detection events with scanning results. Correlation with performance data can uncover denied of service attacks or other types of attacks resulting in unavolutorized use of resources. Correlation with system monitoring information can assist in uncovering attacks and in better relating audit information to operational situations.	AU-12, IR-4	
AU-6 (6)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Correlation with Physical Monitoring	Correlate information from audit records with information obtained from monitoring physical access to further enhance the ability to identify suspicious, inappropriate, unusual, or malevalent activity.	The correlation of physical audit record information and the audit records from systems may assist organizations in identifying suspicious behavior or supporting evidence of such behavior. For example, the correlation of an individual's identity for logical access to certain systems with the additional physical security information that the individual was present at the facility when the logical access occurred, may be useful in investigations.		
AU-6 (7)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Permitted Actions	Specify the permitted actions for each [Selection (one or more): system process; role; user] associated with the review, analysis, and reporting of audit record information.	Organizations specify permitted actions for system processes, roles, and users associated with the review, analysis, and reporting of audit records through system account management activities. Specifying permitted actions on audit record information is a way to enforce the principle of least privilege. Permitted actions are enforced by the system and include read, write, execute, append, and delete.		
AU-6 (8)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Full Text Analysis of Privileged Commands	Perform a full text analysis of logged privileged commands in a physically distinct component or subsystem of the system, or other system that is dedicated to that analysis.	Full text analysis of privileged commands requires a distinct environment for the analysis of audit record information related to privileged users without compromising such information on the system where the users have elevated privileges, including the capability to execute privileged commands. Full text analysis refers to analysis that considers the full text of privileged commands (i.e., commands and parameters) as apposed to analysis that considers only the name of the command. Full text analysis includes the use of pattern motching and heuristics.		

Control ID	lovol	Control Name W	Vithdrawn	Control Toyt	Discussion	Related Controls	Notes
AU-6 (9)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Correlation with Information from Nontechnical Sources	vanus ewn	Correlate information from nontechnical sources with audit record information to enhance organization-wide situational awareness.	Nontechnical sources include records documenting organizational policy violations related to sexual harassment incidents and the improper use of information assets. Such information and lead to a directed analytical effort to detect potential molicious insider activity. Organizations limit access to information that is available from nontechnical sources due to its ensitive nature. Limited access minimizes the potential for inadverent release of privacy-related information to individuals that do not have a need to know. Thus, the correlation of information from nontechnical sources with audit record information generally occurs only when individuals are suspected of being involved in an incident. Organizations obtain legal advice prior to initiating such actions.	PM-12	
AU-6 (10)	2	Audit and Accountability Audit Record Review, Analysis, and Reporting Audit Level Adjustment	Х				[Withdrawn: Incorporated into AU-6]
AU-7	1	Audit and Accountability Audit Record Reduction and Report Generation		Provide and implement an audit record reduction and report generation capability that: a. Supports on-demand audit record review, analysis, and reporting requirements and after-the-fact immestigations of incidents; and b. Does not alter the original content or time ordering of audit records.	organizes such information in a summary format that is more meaningful to analysts. Audit record reduction and report generation capabilities do not always emanate from the same	AC-2, AU-3, AU-4, AU-5, AU-6, AU-12, AU-16, AU-16, AU-16, IR-5, IR-4, PM-12, SI-4	,
AU-7 (1)	2	Audit and Accountability Audit Record Reduction and Report Generation Automatic Processing		Provide and implement the capability to process, sort, and search audit records for events of interest based on the following content: [Assignment: organization-defined fields within audit records].	Events of interest can be identified by the content of audit records including system resources involved, information objects accessed, identities of individuals, event types, event locations, event dates and times, internet Protocol addresses involved, or event success or failure. Organizations may define event criterio to any degree of granularity required, for example, locations selectable by a general networking location or by specific system component.		
AU-7 (2)	2	Audit and Accountability Audit Record Reduction and Report Generation Automatic Sort and Search	Х				[Withdrawn: Incorporated into AU-7 (1)]
AU-8	1	Audit and Accountability Time Stamps		a. Use internal system clocks to generate time stamps for audit records; and b. Record time stamps for audit records that meet [Assignment: organization-defined granularity of time measurement] and that use Coordinated Universal Time, have a fixed local time offset from Coordinated Universal Time, or that include the local time offset as part of the time stamp.	Time stamps generated by the system include date and time. Time is commonly expressed in Coordinated Universal Time (UTC), a modern continuation of Greenwich Mean Time (GMT), or local time with an offset from UTC. Granulative of time measurements refers to the degree of synchronization between system docks and reference clocks, for example, clocks synchronizing within hundreds of milliseconds or tens of milliseconds. Organizations may define different time granularities for different system components. Time service can be critical to other security capabilities such as access control and identification and authentication, depending on the nature of the mechanisms used to support those capabilities.	AU-3, AU-12, AU-14, SC-45	
AU-8 (1)	2	Audit and Accountability Time Stamps Synchronization with Authoritative Time Source		(a) Compare the internal system clocks [Assignment: organization-defined frequency] with [Assignment: organization-defined authoritative time source]; and (b) Synchronize the internal system clocks to the authoritative time source when the time difference is greater than [Assignment: organization-defined time-period].	Synchronization of internal system clocks with an authoritative source provides uniformity of time stamps for systems with multiple system clocks and systems connected over a network.		
AU-8 (2)	2	Audit and Accountability Time Stamps Secondary Authoritative Time Source		(a) Identify a secondary authoritative time source that is in a different geographic region than the primary authoritative time source; and (b) Synchronize the internal system clocks to the secondary authoritative time source if the primary authoritative time source is unavailable.	It may be necessary to employ geolocation information to determine that the secondary authoritative time source is in a different geographic region.		
AU-9	1	Audit and Accountability Protection of Audit Information		Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	audit reports, and personally identifiable information, needed to successfully audit system activity. Audit logging tools are those programs and devices used to conduct system audit		-
AU-9 (1)	2	Audit and Accountability Protection of Audit Information Hardware Write-ance Media		Write audit trails to hardware-enforced, write-once media.	Writing audit trails to hardware-enforced, write-once media applies to the initial generation of audit trails (i.e., the collection of audit records that represents the information to be used for detection, analysis, and reporting purposes) and to the backup of those audit trails. Writing audit trails to hardware-enforced, write-once media does not apply to the initial generation of audit trails. Writing audit trails to hardware-enforced, write-once media does not apply to the initial generation of audit trails. Writing-once, read-many (NVORAM) media includes Compact Disk-Recordable (CD-R) and Digital Versatile Disk-Recordable (DVD-R). In contrast, the use of switchable write-protection media such as an tape cartridges or Universal Serial Bus (USB) drives results in write-protected, but not write-ance, media.	AU-4, AU-5	
AU-9 (2)	2	Audit and Accountability Protection of Audit Information Store on Separate Physical Systems or Components		Store audit records [Assignment: organization-defined frequency] in a repository that is part of a physically different system or system component than the system or component being audited.	Storing audit records in a repository separate from the audited system or system component helps to ensure that a compromise of the system being audited does not also result in a compromise of the audit records. Storing audit records not spearate physical systems or components also preserves the confidentiality and integrity of audit records and facilitates the management of audit records as on organization-wide activity. Storing audit records on separate systems or components applies to initial generation as well as backup or long-term storage of audit records.	AU-4, AU-5	
AU-9 (3)		Audit and Accountability Protection of Audit Information Cryptographic Protection		Implement cryptographic mechanisms to protect the integrity of audit information and audit tools.	signed hash functions using asymmetric cryptography. This enables the distribution of the public key to verify the hash information while maintaining the confidentiality of the secret key used to generate the hash.	AU-10, SC-12, SC-13	
AU-9 (4)		Audit and Accountability Protection of Audit Information Access by Subset of Privileged Users		Authorize access to management of audit logging functionality to only [Assignment: organization-defined subset of privileged users or roles].	audit by that system, may affect the reliability of the audit information by inhibiting audit activities or modifying audit records. Requiring privileged access to be further defined between audit-related privileges and other privileges, limits the number of users or roles with audit-related privileges.	AC-5	
AU-9 (5)	2	Audit and Accountability Protection of Audit Information Dual Authorization		Enforce dual authorization for [Selection (one or more): movement; deletion] of [Assignment: organization- defined audit information].	Organizations may choose different selection options for different types of audit information. Dual authorization mechanisms (also known as two-person control require the approval of two authorized individuols to execute audit functions. To reduce the risk of collusion, organizations consider rotating dual authorization adules to other individuols. Organizations don trequire dual authorization mechanisms when immediate responses are necessary to ensure public and environmental safety.	AC-3	

Control ID	Level	Control Name Withdra	own Control Text	Discussion	Related Controls	Notes
AU-9 (6)	2	Audit and Accountability Protection of Audit Information Read-only Access	Authorize read-only access to audit information to [Assignment: organization-defined subset of privileged users or roles].	Restricting privileged user or role authorizations to read-only helps to limit the potential damage to organizations that could be initiated by such users or roles, for example,	neisted controls	
AU-9 (7)	2	Audit and Accountability Protection of Audit Information Store on Component with Different Operating System	Store audit information on a component running a different operating system than the system or component being audited.	deleting audit records to cover up malicious activity. Storing auditing information on a system component running a different operating system reduces the risk of a vulnerability specific to the system resulting in a compromise of the audit records. Related controls: AU-4, AU-5, AU-11, SC-29.		
AU-10	1	Audit and Accountability Non-repudiation	Provide irrefutable evidence that an individual (or process acting on behalf of an individual) has performed [Assignment: organization-defined actions to be covered by non-repudiation].	Types of Individual actions covered by non-repudiation include creating information, sending and receiving messages, and approving information. Non-repudiation protects against claims by authors of not having authored certain documents; senders of not having transmitted messages; receivers of not having received messages; and signatories of not having signed documents. Non-repudiation services can be used to determine if information originated from an individual, or if an individual took specific actions (e.g., sending an email, signing a contract, or approving a procurrement request, or received specific information). Organizations obtain non-repudiation services by employing various techniques or mechanisms, including digital signatures and digital message receipts.	AU-9, PM-12, SA-8, SC-8, SC-12, SC-13, SC-16, SC-17, SC-23	
AU-10 (1)		Audit and Accountability Non-repudiation Association of identities	(a) Bind the identity of the information producer with the information to [Assignment: organization-defined strength of binding]; and (b) Provide the means for authorized individuals to determine the identity of the producer of the information.	Binding identities to the information supports audit requirements that provide organizational personnel with the means to identify who produced specific information in the event of an information transfer. Organizations determine and approve the strength of attribute binding between the information producer and the information based on the security category of the information and other relevant risk factors.	AC-4, AC-16	
AU-10 (2)	2	Audit and Accountability Non-repudiation Validate Binding of Information Producer Identity	 (a) Validate the binding of the information producer identity to the information at [Assignment: organization-defined frequency]; and (b) Perform [Assignment: organization-defined actions] in the event of a validation error. 	Validating the binding of the information producer identity to the information prevents the modification of information between production and review. The validation of bindings can be achieved, for example, using cryptographic checksums. Organizations determine if validations are in response to user requests or generated automatically.	AC-3, AC-4, AC-16	
AU-10 (3)	2	Audit and Accountability Non-repudiation Chain of Custody	Maintain reviewer or releaser identity and credentials within the established chain of custody for information reviewed or released.	Chain of custody is a process that tracks the movement of evidence through its collection, safeguarding, and analysis life cycle by documenting each person who handled the evidence, the date and time it was collected or transferred, and the purpose for the transfer. If the reviewer is a human or if the review function is automated but separate from the release or transfer function, the system associates the identity of the reviewer of the information to be released with the information and the information label. In the case of human reviews, maintaining the identity and credentials of reviewers or releasers provides organizational officials the means to identify who reviewed and released the information. In the case of automated reviews, it ensures that only approved review functions are used.	AC-4, AC-16	
AU-10 (4)	2	Audit and Accountability Non-repudiation Validate Binding of Information Reviewer Identity	(a) Validate the binding of the information reviewer identity to the information at the transfer or release points prior to release or transfer between [Assignment: arganization-defined security domains], and (b) Perform [Assignment: arganization-defined actions] in the event of a validation error.	Validating the binding of the information reviewer identity to the information at transfer or release points prevents the unauthorized modification of information between review and the transfer or release. The validation of bindings can be achieved by using cryptographic checksums. Organizations determine if validations are in response to user requests or generated automatically.	AC-4, AC-16	
AU-10 (5)	2	Audit and Accountability Non-repudiation Digital	X			[Withdrawn: Incorporated into SI-7]
AU-11	1	Audit and Accountability Audit Record Retention	Retain audit records for [Assignment: organization-defined time-period consistent with records retention policy] to provide support for after-the-fact investigations of incidents and to meet regulatory and organizational information retention requirements.	Organizations retain audit records until it is determined that the records are no longer needed for administrative, legal, audit, or other operational purposes. This includes the retention and availability of audit records relative for Freedom of Information Act (FOIA) requests, subpoenas, and law enforcement actions. Organizations develop standard categories of audit records relative to such types of actions and standard response processes for each type of action. The National Archives and Records Administration (NARA) General Records Schedules provide federal policy on record retention.	AU-2, AU-4, AU-5, AU 6, AU-9, AU-14, MP- 6, RA-5, SI-12	
AU-11 (1)	2	Audit and Accountability Audit Record Retention Long-term Retrieval Capability	Employ [Assignment: organization-defined measures] to ensure that long-term audit records generated by the system can be retrieved.	Organizations need to access and read audit records requiring long-term storage (on the order of years). Measures employed to help facilitate the retireval of undit records include converting records to newer formsts, retaining equipment capable of reading the records, and retaining necessary documentation to help personnel understand how to interpret the records.		
AU-12		Audit and Accountability Audit Record Generation	a. Provide audit record generation capability for the event types the system is capable of auditing as defined in AU-2a on [Assignment: organization-defined system components]; b. Allow [Assignment: organization-defined personnel or roles] to select the event types that are to be logged by specific components of the system; and c. Generate audit records for the event types defined in AU-2c that include the audit record content defined in AU-3.	Audit records can be generated from many different system components. The event types specified in AU-2d are the event types for which audit logs are to be generated and are a subset of all event types for which the system can generate audit records.	AC-6, AC-17, AU-2, AU-3, AU-4, AU-5, AU 6, AU-7, AU-14, CM- 5, MA-4, MP-4, PM- 12, SA-8, SC-18, SI-3, SI-4, SI-7, SI-10	
AU-12 (1)	2	Audit and Accountability Audit Record Generation System-wide and Time-correlated Audit Trail	Compile audit records fram [Assignment: organization-defined system components] into a system-wide (logical or physical) audit trail that is time-correlated to within [Assignment: organization-defined level of tolerance for the relationship between time stamps of individual records in the audit trail].	Audit trails are time-correlated if the time stamps in the individual audit records can be reliably related to the time stamps in other audit records to achieve a time ordering of the records within organizational tolerances.	AU-8	
AU-12 (2)	2	Audit and Accountability Audit Record Generation Standardized Formats	Produce a system-wide (logical or physical) audit trail composed of audit records in a standardized format.	Audit records that follow common standards promote interoperability and information exchange between devices and systems. This facilitates the production of event information that can be readily analyzed and correlated. Standard formats for audit records include records that are compliant with Common tevent Expressions, I fogging mechanisms within systems do not conform to standardized formats, systems may convert individual audit records into standardized formats when compiling system-wide audit trails.		
AU-12 (3)		Audit and Accountability Audit Record Generation Changes by Authorized Individuals	Provide and implement the capability for [Assignment: organization-defined individuals or roles] to change the logging to be performed on [Assignment: organization-defined system components] based on [Assignment: organization-defined selectable event criterial within [Assignment: organization-defined time thresholds].	Permitting authorized individuals to make changes to system logging enables organizations to extend or limit logging as necessary to meet organizational requirements. Logging that is limited to conserve system resources may be extended (either temporarily or permanently) to address certain threat situations. In addition, logging may be limited to a specific set of event types to facilitate oudit reduction, analysis, and reporting. Organizations can establish time thresholds in which logging actions are changed, for example, near real-time, within minutes, or within hours.	AC-3	
AU-12 (4)	2	Audit and Accountability Audit Record Generation Query Parameter Audits of Personally Identifiable Information	Provide and implement the copability for auditing the parameters of user query events for data sets containing personally identifiable information.	Query parameters are explicit criteria that an individual or an automated system submits to a system to retiree data. Auditing of query parameters for datasets that contain personally identifiable information augments the capability of an organization to track and understand the access, usage, or sharing of personally identifiable information by authorized personnel.

CA 2	Level	Control Name Withdrawn	Control Text	Discussion Organizations assess controls in systems and the environments in which those systems operate as part of initial and ongoing		Notes
CA-2	1	Assessment, Authorization, and Monitoring Control	a. Develop a control assessment plan that describes the scope of the assessment including:	authorizations; continuous monitoring; FISMA annual assessments; system design and development; systems security	AC-20, CA-5, CA-6, CA-	
, ,		Assessments	Controls and control enhancements under assessment;	engineering; and the system development life cycle. Assessments help to ensure that organizations meet information security	7, PM-9, RA-5, SA-11,	
			2. Assessment procedures to be used to determine control effectiveness; and	and privacy requirements; identify weaknesses and deficiencies in the system design and development process; provide	SC-38, SI-3, SI-12, SR-	
, ,			Assessment environment, assessment team, and assessment roles and responsibilities;	essential information needed to make risk-based decisions as part of authorization processes; and comply with vulnerability	2, SR-3	
, ,			b. Ensure the control assessment plan is reviewed and approved by the authorizing official or designated	mitigation procedures. Organizations conduct assessments on the implemented controls as documented in security and privacy plans. Assessments can also be conducted throughout the system development life cycle as part of systems		
			representative prior to conducting the assessment;	engineering and systems security engineering processes. For example, the design for the controls can be assessed as RFPs are		
			c. Assess the controls in the system and its environment of operation [Assignment: organization-defined	developed and responses assessed, and as design reviews are conducted. If design to implement controls and subsequent		
			frequency] to determine the extent to which the controls are implemented correctly, operating as intended, an	implementation in accordance with the design is assessed during development, the final control testing can be a simple		
			producing the desired outcome with respect to meeting established security and privacy requirements;	confirmation utilizing previously completed control assessment and aggregating the outcomes. Organizations may develop a single, consolidated security and privacy assessment plan for the system or maintain separate		
			d. Produce a control assessment report that document the results of the assessment; and	organizations may develop a single, consolidated security and privacy assessment plan for the system or maintain separate		
				organizations participate in assessing a system, a coordinated approach can reduce redundancies and associated costs.		
			e. Provide the results of the control assessment to [Assignment: organization-defined individuals or roles].	Organizations can use other types of assessment activities such as vulnerability scanning and system monitoring to maintain		
				the security and privacy posture of systems during the system life cycle. Assessment reports document assessment results in sufficient detail as deemed necessary by organizations, to determine the accuracy and completeness of the reports and		
				whether the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to		
				meeting requirements. Assessment results are provided to the individuals or roles appropriate for the types of assessments		
				being conducted. For example, assessments conducted in support of authorization decisions are provided to authorizing		
				officials, senior agency officials for privacy, senior agency information security officers, and authorizing official designated representatives.		
				To satisfy annual assessment requirements, organizations can use assessment results from the following sources: initial or		
				ongoing system authorizations; continuous monitoring; systems engineering processes, or system development life cycle		
				activities. Organizations ensure that assessment results are current, relevant to the determination of control effectiveness,		
				and obtained with the appropriate level of assessor independence. Existing control assessment results can be reused to the extent that the results are still valid and can also be supplemented with additional assessments as needed. After the initial		
				authorizations, organizations assess controls during continuous monitoring. Organizations also establish the frequency for		
				ongoing assessments in accordance with organizational continuous monitoring strategies. External audits, including audits by		
	1			external entities such as regulatory agencies, are outside the scope of this control.		
	I					
	I					
CA-2 (1)	2	Assessment, Authorization, and Monitoring Control	Employ independent assessors or assessment teams to conduct control assessments.	Independent assessors or assessment teams are individuals or groups conducting impartial		
		Assessments Independent Assessors		assessments of systems. Impartiality means that assessors are free from any perceived or		
				actual conflicts of interest regarding development, operation, sustainment, or management		
				of the systems under assessment or the determination of control effectiveness. To achieve		
				impartiality, assessors do not create a mutual or conflicting interest with the organizations		
				where the assessments are being conducted; assess their own work; act as management or		
				employees of the organizations they are serving; or place themselves in positions of		
				advocacy for the organizations acquiring their services.		
				Independent assessments can be obtained from elements within organizations or can be		
				contracted to public or private sector entities outside of organizations. Authorizing officials		
				determine the required level of independence based on the security categories of systems		
				and/or the risk to organizational operations, organizational assets, or individuals.		
				Authorizing officials also determine if the level of assessor independence provides sufficient		
				assurance that the results are sound and can be used to make credible, risk-based		
				decisions. Assessor independence determination also includes whether contracted		
				assessment services have sufficient independence, for example, when system owners are		
				not directly involved in contracting processes or cannot influence the impartiality of the		
				assessors conducting the assessments. During the system design and development phase,		
				the analogy to independent assessors is having independent SMEs involved in design		
				When organizations that own the systems are small or the structures of the organizations		
				require that assessments are conducted by individuals that are in the developmental,		
				operational, or management chain of the system owners, independence in assessment		
				processes can be achieved by ensuring that assessment results are carefully reviewed and		
				analyzed by independent teams of experts to validate the completeness, accuracy, integrity,		
				and reliability of the results. Assessments performed for purposes other than to support		
				authorization decisions, are more likely to be useable for such decisions when performed by

Assign a senior official as the authorizing official for common controls available for inheritance by organizational systems; c. Ensure that the authorizing official for the system, before commencing operations: 1. Accepts the use of common controls inherited by the system; and 2. Authorizes the system to operate; d. Ensure that the authorizing official for common controls authorizes the use of those controls for inheritance by organizational systems; e. Update the authorizations [Assignment: organization-defined frequency].		CA-2, CA-3, CA-7, PM- 9, PM-10, SA-10, SI- 12	
					programs reduce the need for separate reauthorization processes. Through the employment of comprehensive continuous monitoring processes, the information contained in authorization packages (i.e., the security and privacy plans, assessment reports, and plans of action and milestones), is updated on an onegoing basis. This provides authorizing officials, system owners, and common control providers with an up-to-date status of the security and privacy posture of their systems, controls, and operating environments. To reduce the cost of reauthorization, authorizing officials can leverage the results of continuous monitoring processes to the maximum extent possible as the basis for rendering reauthorization decisions.		
CA-6 (1)		Assessment, Authorization, and Monitoring Authorization Joint Authorization — Intra- organization		Employ a joint outhorization process for the system that includes multiple authorizing officials from the same organization conducting the authorization.	authorizing afficials for the system, increases the level of independence in the risk-based decision-making process. It also implements the concepts of separation of duties and dual authorization as applied to the system authorization process. The intra-organization joint authorization process is most relevant for connected systems, shared systems, and systems with multiple information owners.	AC-6	
CA-6 (2)	2	Assessment, Authorization, and Monitoring Authorization Joint Authorization — Inter- organization		Employ a joint authorization process for the system that includes multiple authorizing officials with at least one authorizing official from an organization external to the organization conducting the authorization.	Assigning multiple authorizing officials, at least one of which comes from an external arganization, to serve as co-authorizing officials for the system, increases the level of independence in the risk-based decision-making process. It implements the concepts of separation of duties and dual authorization as applied to the system authorization process. Employing authorizing officials from external organizations to supplement the authorizing official from the organization owning or hosting the system may be necessary when the external organizations have a vested interest or equilities in the outcome of the authorization decision. The inter-organization joint authorization process is relevant and appropriate for connected systems, shared systems or services, and systems with multiple information owners. The authorizing officials from the external organizations are key stokeholders of the system undergoing authorization.	AC-6	
CA-7	1	Assessment, Authorization, and Monitoring Continuous Monitoring		Develop a system-level continuous monitoring strategy and implement continuous monitoring in accordance with the organization-level continuous monitoring strategy that includes: a. Establishing the following system-level metrics to be monitored: [Assignment: organization-defined system-level metrics]: b. Establishing [Assignment: organization-defined frequencies] for monitoring and [Assignment: organization-defined frequencies] for assessment of control effectiveness; c. Ongoling control assessments in accordance with the continuous monitoring strategy; d. Ongoling monitoring of system and organization-defined metrics in accordance with the continuous monitoring strategy; e. Correlation and analysis of information generated by control assessments and monitoring; f. Response actions to address results of the analysis of control assessment and monitoring information; and g. Reporting the security and privacy status of the system to [Assignment: organization-defined personnel or roles] [Assignment: organization-defined frequency].	security and privacy posture to support organizational risk management decisions. The terms continuous and ongoing imply that organizations assess and monitor their controls and risks at a frequency sufficient to support risk-based decisions. Different types of controls may require different monitoring frequencies. The results of continuous monitoring generate risk response actions by organizations. When monitoring the effectiveness of multiple controls that have been grouped into capabilities, a root-cause analysis may be needed to determine the specific control that has failed. Continuous monitoring programs allow organizations to maintain the authorizations of systems and common controls in highly dynamic environments of operation with changing mission and business needs, threats, vulnerabilities, and technologies. Having access to security and privacy information on a continuing basis through reports and dashboards gives organizational officials the ability to make effective and timely risk management decisions, including ongoing authorization decisions.	28, PM-31, PS-7, PT- 8, RA-3, RA-5, RA-7, SA-8, SA-9, SA-11, SC- 5, SC-7, SC-18, SC-38, SC-43, SC-38, SI-3, SI-	
CA-7 (1)	2	Assessment, Authorization, and Monitoring Continuous Monitoring Independent Assessment		Employ independent assessors or assessment teams to monitor the controls in the system on an ongoing basis.	Organizations maximize the value of control assessments by requiring that assessments be conducted by assessors with appropriate levels of independence. The level of required independence is based an arganizational continuous monitoring strategies. Assessor independence provides a degree of impartiality to the monitoring process. To achieve such impartiality, assessors do not create a mutual or conflicting interest with the arganizations where the assessments are being conducted; assess their own work, cut as management or employees of the organizations they are serving; or place themselves in advocacy positions for the organizations acquiring their services.		
CA-7 (2)	2	Assessment, Authorization, and Monitoring	Х				[Withdrawn: Incorporated into CA-2]
CA-7 (3)	2	Continuous Monitoring Types of Assessments Assessment, Authorization, and Monitoring Continuous Monitoring Trend Analyses		Employ trend analyses to determine if control implementations, the frequency of continuous monitoring activities, and the types of activities used in the continuous monitoring process need to be modified based on empirical data.	Trend analyses include examining recent threat information addressing the types of threat events that have occurred within the organization or the federal government; success rates of certain types of attacks; emerging vulnerabilities in technologies; evolving social engineering techniques; the effectiveness of configuration settings, results from multiple control assessments; and findings from inspectors General or auditors.		

Control ID	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls	Notes
CA-7 (4)	2	Assessment, Authorization, and Monitoring Continuous Monitoring Risk Monitoring	Ensure risk monitoring is an integral part of the continuous monitoring strategy that includes the fallowing: (a) Effectiveness monitoring; (b) Compliance monitoring; and (c) Change monitoring.	Risk monitoring is informed by the established organizational risk tolerance. Effectiveness monitoring determines the ongoing effectiveness of the implemented risk response measures. Compliance monitoring verifies that required risk response measures rome measures are implemented. It also verifies that security and privacy requirements are satisfied. Change monitoring identifies changes to organizational systems and environments of operation that may affect security and privacy risk.	Related Controls	
CA-7(5)	2	Assessment, Authorization, and Monitoring Continuous Monitoring Consistency Analysis	Employ the following actions to validate that policies are established and implemented controls are operating in a consistent manner: [Assignment: organization-defined actions].	Security and privacy controls are aften added incrementally to a system. As a result, policies for selecting and implementing controls and ye inconsistent and the controls could fall to work together in a consistent or coordinated manner. At a minimum, the lock of consistency and coordination could men that there are unacceptable security and privacy agas in the system. At worst, it could mean that some of the controls implemented in one location or by one component are actually impeding the functionality of other controls (e.g., encrypting internal network traffic can impedie monitoring). In in other situations, failing to consistently monitor all implemented network protocols (e.g., a dual stack of Irv4 and Irv5) may create unintended vulnerabilities in the system that could be explicited by adversaries. It is important to validate through testing, monitoring, and analysis that the implemented controls are operating in a consistent, coordinated, non-interfering manner.		
CA-8	1	Assessment, Authorization, and Monitoring Penetration Testing	Conduct penetration testing [Assignment: organization-defined frequency] on [Assignment: organization-defined systems or system components].	Penetration testing is a specialized type of assessment conducted on systems or individual system components to identify vulnerabilities that could be exploited by adversaries. Penetration testing goes beyond automated vulnerabilities and and is conducted by agents and is conducted by agents and teams with demonstrable skills and experience that include technical expertise in network, operating system, and/or application level security. Penetration testing active systems to adversaries within specified constraints. Such constraints include time, resources, and skills. Penetration testing attempts to duplicate the actions of adversaries in carrying out attacks and provides a more in-depth analysis of security-and privacy-related weaknesses or deficiencies. Penetration testing is especially important when organizations are transitioning from older technologies to newer technologies (e.g., transitioning from livel to livel for hetwork protocols). Organizations can use the results of vulnerability analyses to support penetration testing activities. Penetration testing can be conducted internally or externally on the hardware, software, or firmware components of a system and can exercise both physical and technical controls. A standard method for penetration testing includes pretest analysis based on full knowledge of the system; pretest identification of potential vulnerabilities. All parties geoigend to determine exploitability of unlerabilities. All parties geoigen to determine exploitability of unlerabilities. All parties geoigen to determine exploitability of unlerabilities. All parties greated to the rules of engagement for the penetration tests with the tools, techniques, and procedures that are anticipated to be employed by adversaries. Risk assessments guide the decisions on the level of independence required for the personnel conducting penetration testing.	SA-11, SR-5, SR-6	
CA-8 (1)	2	Assessment, Authorization, and Monitoring Penetration Testing Independent Penetration Testing Agent or Team	Employ an independent penetration testing agent or team to perform penetration testing on the system or system components.	Independent penetration testing ogents or teams are individuals or groups who conduct importal penetration testing of organizational systems. Importality implies that penetration testing agents or teams are free from perceived or actual conflicts of interest with respect to the development, operation, or management of the systems that are the targets of the penetration testing. CA-(21) provides additional information on independent assessments that can be applied to penetration testing.	CA-2	
CA-8 (2)	2	Assessment, Authorization, and Monitoring Penetration Testing Red Team Exercises	Employ the following red-team exercises to simulate attempts by adversaries to compromise organizational systems in accordance with applicable rules of engagement: [Assignment: organization-defined red team exercises].	Red team exercises extend the objectives of penetration testing by examining the security and privacy positive of organizations and the capability to implement effective cyber defenses. Red team exercises simulate attempts by adversaries to compromise missions and business functions and provide a comprehensive assessment of the security and privacy posture of systems and arganizations. Such attempts may include technology-based attacks and social engineering-based attacks. Technology-based attacks include interactions with hardware, software, or firmware components and/or mission and business processes. Social engineering-based attacks include interactions with entering social engineering-based attacks include interactions with entering testing and experience with current adversarial tactics, techniques, procedures, and tools. While penetration testing may be primarily laboratory-based testing, organizations can use red team exercises to provide more comprehensive assessments that reflect real-world conditions. The results from red team exercises are an exercise and training and to assess control effectiveness.		
CA-8 (3)	2	Assessment, Authorization, and Monitoring Penetration Testing Facility Penetration Testing	Employ a penetration testing process that includes [Assignment: organization-defined frequency] [Selection: announced; unannounced] attempts to bypass or circumvent controls associated with physical access points to the facility.	Penetration testing of physical access points can provide information on critical wulnerabilities in the operating environments of organizational systems. Such information can be used to correct weaknesses or deficiencies in physical controls that are necessary to protect organizational systems.	CA-2, PE-3	
CA-9	1	Assessment, Authorization, and Monitoring Internal System Connections	a. Authorize internal connections of [Assignment: organization-defined system components or classes of components to the system; b. Document, for each internal connection, the interface characteristics, security and privacy requirements, and the nature of the information communicated; c. Terminate internal system connections after [Assignment: organization-defined conditions]; and d. Review [Assignment: organization-defined frequency] the continued need for each internal connection.	Internal system connections are connections between organizational systems and separate constituent system components (i.e., connections between components that are part of the same system). Intra-system connections include connections with mobile devices, notebook and desktop computers, workstations, printers, copiers, facsimile machines, scanners, sensors, and servers. Instead of authorizing each individual internal system connection, organizations can authorize internal connections for a class of system components with common characteristics and/or configurations, including printers, scanners, and copiers with a specified processing, transmission, and storage capability; or smart phones and tablets with a specific baseline configuration. The continued need for an internal system connection is reviewed from the perspective of whether it provides support for organizational missions or business functions.	19, CM-2, IA-3, SC-7,	
		Assessment, Authorization, and Monitoring Internal System Connections Compliance Checks	Perform security and privacy compliance checks on constituent system components prior to the establishment of the internal connection.	Compliance checks include verification of the relevant baseline configuration.	CM-6	
CM	0	Configuration Management				

Control ID CM-1	1	Configuration Management Policy and Procedures Configuration Management Baseline Configuration		Control Text a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. Selection (one or more): organization-level; mission/business process-level; system-level] configuration management policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and (b) is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and facilitate the implementation of the configuration management policy and the associated configuration management controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the configuration management policy and procedures; and c. Review and update the current configuration management; 2. Procedures [Assignment: organization-defined frequency]: a. Develop, document, and maintain under configuration control, a current baseline configuration of the system; d. Review and update the baseline configuration of the system: 1. [Assignment: organization-defined frequency]; 2. When required due to [Assignment: Assignment organization-defined circumstances]; and 3. When system components are installed or upgraded.	operational, and communications aspects of systems. Baseline configurations are documented, formally reviewed and agreed-upon specifications for systems or configuration items within those systems. Baseline configurations serve as a basis for future builds, releases, or changes to systems and include security and privacy control implementations, operational procedures, information about system components, network topology, and logical placement of components in the system architecture. Maintaining	AC-19, AU-6, CA-9, CM-1, CM-3, CM-5, CM-6, CM-8, CM-9, CP-9, CP-10, CP-12, MA-2, PL-8, PM-2, PM-2, PL-8, PM-2, PM-	Notes
CM-2 (1)	2	Configuration Management Baseline Configuration	X		baseline configurations requires creating new baselines as organizational systems change over time. Baseline configurations of systems reflect the current enterprise architecture.		[Withdrawn: Incorporated into CM-2]
CM-2 (2)	2	Configuration Wanagement Buseline Configuration Reviews and Updates Configuration Management Buseline Configuration Automation Support for Accuracy and Currency	^	Maintain the currency, completeness, accuracy, and availability of the baseline configuration of the system using [Assignment: organization-defined automated mechanisms].	Automated mechanisms that help organizations maintain consistent baseline configurations for systems include configuration management tools, hardware, software, and firmware inventory tools, and network management tools. Automated tools can be used at the organization level, mission/business process level or system level on workstations, servers, notebook computers, network components, or mobile devices. Tools can be used to track version numbers on operating systems, applications, types of software installed, and current patch levels. Automation support for accuracy and currency can be satisfied by the implementation of CM-8(2) for organizations that combine system component inventory and baseline configuration activities.	CM-7, IA-3, RA-5	
CM-2 (3)	2	Configuration Management Baseline Configuration Retention of Previous Configurations		Retain [Assignment: organization-defined number] of previous versions of baseline configurations of the system to support rollback.	Retaining previous versions of baseline configurations to support rollback include hardware, software, firmware, configuration files, and configuration records.		
CM-2 (4)	2	Configuration Management Baseline Configuration Unauthorized Software	X				[Withdrawn: Incorporated into CM-7]
CM-2 (5)	2	Configuration Management Baseline Configuration Authorized Software	X				[Withdrawn: Incorporated into CM-7]
CM-2 (6)	2	Configuration Management Baseline Configuration Development and Test Environments		Maintain a baseline configuration for system development and test environments that is managed separately from the aperational baseline configuration.	Establishing separate baseline configurations for development, testing, and operational environments protects systems from unplanned or unexpected events related to development and testing activities. Separate baseline configurations allow organizations to apply the configuration management that is most appropriate for each type of configuration. For example, the management of operational configurations typically emphasizes the need for stability, while the management of development or test configurations requires greater flexibility. Configurations in the test environment mirror configurations in the operational environment to the extent practicable so that the results of the testing are representative of the proposed changes to the operational systems. Separate baseline configurations does not necessarily require separate physical environments.	CM-4, SC-3, SC-7	
CM-2 (7)	2	Configuration Management Baseline Configuration Configure Systems and Components for High-risk Areas		(a) Issue [Assignment: organization-defined systems or system components] with [Assignment: organization-defined configurations] to individuals traveling to locations that the organization deems to be of significant risk; and (b) Apply the following controls to the systems or components when the individuals return from travel: [Assignment: organization-defined controls].	When it is known that systems or system components will be in high-risk areas external to the organization, additional controls may be implemented to counter the increased threat in such areas. For example, organizations can take actions for notebook computers used by individuals departing on and returning from travel. Actions include determining the locations that one of concern, defining the required configurations for the components, ensuring that components are configured as intended before travel is initiated, and applying controls to the components after travel is completed. Specially configured anotebook computers include computers with smitted and articles, limited applications, and more stringent configuration settings. Controls applied to mobile devices upon return from at ravel include examining the mobile device for sign of physical tampering and puring and reimaging disk drives. Protecting information that resides on mobile devices is addressed in the MP (Media Protection) family.		
CM-3	1	Configuration Management Configuration Change Control		a. Determine and document the types of changes to the system that are configuration-controlled; b. Review proposed configuration-controlled changes to the system and approve or disapprove such changes with explicit consideration for security and privacy impact analyses; c. Document configuration change decisions associated with the system; c. Decument configuration change decisions associated with the system; e. Retain records of configuration-controlled changes to the system; e. Retain records of configuration-controlled changes to the system for [Assignment: organization-defined time-period]; f. Monitor and review activities associated with configuration-controlled changes to the system; and g. Coordinate and provide oversight for configuration change control climited changes to the system; and g. Coordinate and provide oversight for configuration change control climited changes to the system; [Assignment: organization-defined configuration change control element] that convenes [Selection (one or more): [Assignment: organization-defined configuration change conditions]].	justification, implementation, testing, review, and disposition of system changes, including system upgrades and modifications. Configuration change control includes changes to baseline configurations and configuration items of systems; changes to operational procedures; changes to configuration settings for system components; unscheduled or

		Safeguards					
CM-6	1	Configuration Management Configuration Settings		a. Establish and document configuration settings for components employed within the system using [Assignment: organization-defined common secure configurations] that reflect the most restrictive mode consistent with operational requirements; b. Implement the configuration settings; c. Identify, document, and approve any deviations from established configuration settings for [Assignment: organization-defined system components] based on [Assignment: organization-defined operational requirements]; and d. Monitor and control changes to the configuration settings in accordance with organizational policies and procedures.	firmware components of the system that affect the security posture or functionality of the system. Information technology products for which security-related configuration settings can be defined include mainframe computers, servers, workstations, operating systems, mobile devices, input/output devices, protocols, and applications. Security parameters are parameters impacting the security posture of systems, including the parameters required to satisfy other security control requirements. Security parameters include registry settings; account, file, or directory	CM-11, CP-7, CP-9.	
CM-6 (1)	2	Configuration Management Configuration Settings Automated Management, Application, and Verification		Centrally manage, apply, and verify configuration settings for [Assignment: organization-defined system components] using [Assignment: organization-defined automated mechanisms].	Automated tools (e.g., security information and event management tools or enterprise security monitoring tools) (an improve the accuracy, consistency, and availability of configuration settings information. Automation can also provide data aggregation and data correlation capabilities; alerting mechanisms; and dashboards to support risk-based decision making within the organization.	CA-7	
CM-6 (2)	2	Configuration Management Configuration Settings Respond to Unauthorized Changes		Take the following actions in response to unauthorized changes to [Assignment: organization-defined configuration settings]: [Assignment: organization-defined actions].	Responses to unauthorized changes to configuration settings include alerting designated organizational personnel, restoring established configuration settings, or in extreme cases, halting affected system processing.	IR-4, IR-6, SI-7	
CM-6 (3)	2	Configuration Management Configuration Settings Unauthorized Change Detection	Х		,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,		[Withdrawn: Incorporated into SI-7]
CM-6 (4)	2	Configuration Management Configuration Settings	Х				[Withdrawn: Incorporated into CM-4]
CM-7	1	Configuration Management Least Functionality		Configure the system to provide only [Assignment: organization-defined mission essential capabilities]; and b. Prohibit or restrict the use of the following functions, ports, protocols, software, and/or services: [Assignment: organization-defined prohibited or restricted functions, ports, protocols, software, and/or services].		8, SA-9, SA-15, SC-2,	
CM-7 (1)	2	Configuration Management Least Functionality Periodic Review		(a) Review the system [Assignment: organization-defined frequency] to identify unnecessary and/or nonsecure functions, ports, protocols, software, and services, and (b) Disable or remove [Assignment: organization-defined functions, ports, protocols, software, and services within the system deemed to be unnecessary and/or nonsecure].	Organizations review functions, ports, protocols, and services provided by systems or system components to determine the functions and services that are condidates for elimination. Such reviews are especially important during transition periods from older technologies to newer technologies (e.g., transition from IPv4 to IPv6). These technology transitions may require implementing the older and newer technologies simultaneously during the transition period and returning to minimum essential functions, ports, protocols, and services at the earliest opportunity. Organizations can either decide the relative security of the function, port, protocol, and/s reviece to base the security decision on the assessment of other entities. Unsecure protocols include Bluetooth, FTP, and peer-to-peer networking.	AC-18	

		A section with the	* · · · ·		
Control ID CM-7 (2)	2	Control Name Withdrawn Configuration Management Least Functionality	Control Text Prevent program execution in accordance with [Selection (one or more): [Assignment: organization-defined	Prevention of program execution addresses organizational policies, rules of behavior,	CM-8, PL-4, PM-5, PS-
CW-7 (2)	2	Prevent Program Execution	policies, Julies of behavior, and/or access agreements regarding software program usage and restrictions]; rules authorizing the terms and conditions of software program usage].	and/or access agreements restricting software usage and the terms and conditions imposed by the developer or manufacturer, including software ileansing and copyrights. Restrictions include prohibiting out execute features: restricting roles allowed to approve program execution; program blacklisting and whitelisting; or restricting the number of program instances executed at the same time.	6
CM-7 (3)	2	Configuration Management Least Functionality Registration Compliance	Ensure compliance with [Assignment: organization-defined registration requirements for functions, ports, protocols, and services].	Organizations use the registration process to manage, track, and provide oversight for systems and implemented functions, ports, protocols, and services.	
CM-7 (4)	2	Configuration Management Least Functionality Unauthorized Software — Blacklisting	 (a) Identify [Assignment: organization-defined software programs not authorized to execute on the system]; (b) Employ an allow-all, deny-by-exception policy to prohibit the execution of unauthorized software programs on the system; and (c) Review and update the list of unauthorized software programs [Assignment: organization-defined frequency]. 	The process used to identify software programs or categories of software programs that are not authorized to execute an organizational systems is commonly referred to as blacklisting. Software pragmas identified can be limited to specific versions or from a specific source. The concept of blacklisting may also be applied to user actions, ports, IP addresses, and media access control (MAC) addresses.	
CM-7 (5)	2	Configuration Management Least Functionality Authorized Software — Whitelisting	 (a) Identify (Assignment: organization-defined software programs authorized to execute on the system); (b) Employ a deny-all, permit-by-exception policy to allow the execution of authorized software programs on the system; and (c) Review and update the list of authorized software programs [Assignment: organization-defined frequency]. 	The process used to identify specific software programs or entire categories of software programs that are authorized to execute on arganizational systems is commonly referred to as whitelisting. Software programs identified can be limited to specific versions or from a specific source. To facilitate comprehensive whitelisting and increase the strength of protection for attacks that byposs application levels whitelisting, software programs may be decomposed into and monitored at different levels of detail. Software programs levels of detail include applications, application programming interforces, application modules, scripts, system processes, system services, kernel functions, registries, drivers, and dynamic link libraries. The concept of whitelisting may also be applied to user actions, parts, IP addresses, and media access control (MAC) addresses. Organizations consider verifying the integrity of white-listed software programs using, cryptographic checksums, digital signatures, or hash functions. Verification of white-listed software can occur either prior to execution or at system startup. Whitelisting of URLs for websites is addressed in CA-3(5) and SC-7.	CM-2, CM-6, CM-8, CM-10, M-5, SA-10, SC-34, SI-7
CM-7 (6)	2	Configuration Management Least Functionality Confined Environments with Limited Privileges	Require that the following user-installed software execute in a confined physical or virtual machine environment with limited privileges: [Assignment: organization-defined user-installed software].	Organizations identify software that may be of concern regarding its origin or potential for containing malicious code. For this type of software, user installations occur in confined environments of operation to limit or contain damage from malicious code that may be executed.	CM-11, SC-44
CM-7 (7)	2	Configuration Management Least Functionality Code Execution in Protected Environments	Allow execution of binary or machine-executable code only in confined physical or virtual machine environments and with the explicit approval of [Assignment: organization-defined personnel or roles] when such code is: (a) Obtained from sources with limited or no warranty; and/or (b) Without the provision of source code.	This control enhancement applies to all sources of binary or machine-executable code, including commercial software and firmware and open source software.	CM-10, SC-44
CM-7 (8)	2	Configuration Management Least Functionality Binary or Machine Executable Code	(a) Prohibit the use of binary or machine-executable code from sources with limited or no warranty or without the provision of source code; and (b) Allow exceptions only for compelling mission or operational requirements and with the approval of the authorizing official.	This control enhancement applies to all sources of binary or machine-executable code, including commercial software and firmware and open source software. Organizations assess software products without accompanying source code or from sources with limited or no warranty for potential security impacts. The assessments address the fact that software products without the provision of source code may be difficult to review, repair, or extend. In addition, there may be no owners to make such repairs on behalf of organizations. If open source software is used, the assessments address the fact that there is no warranty, the open source software could contain back doors or molware, and there may be no support available.	SA-5, SA-22
CM-8	1	Configuration Management System Component Inventory	a. Develop and document an inventory of system components that: 1. Accurately reflects the system; 2. Includes all components within the system; 3. Is at the level of granularity deemed necessary for tracking and reporting; and 4. Includes the following information to achieve system component accountability. [Assignment: organization-defined information deemed necessary to achieve effective system component accountability); and b. Review and update the system component inventory [Assignment: organization-defined frequency].		MA-6, PE-20, PM-5,
CM-8 (1)		Configuration Management System Component Inventory Updates During Installation and Removal	Update the inventory of system components as part of component installations, removals, and system updates.	Organizations can improve the accuracy, completeness, and consistency of system component inventories if the inventories are updated routinely as part of component installations or enrowals, are during general system updates. If liventieries are not updated at these key times, there is a greater likelihood that the information will not be appropriately coptured and documented. System updates include hardware, software, and firmware components.	PM-16
CM-8 (2)	2	Configuration Management System Component Inventory Automated Maintenance	Maintain the currency, completeness, accuracy, and availability of the inventory of system components using [Assignment: organization-defined automated mechanisms].	Organizations maintain system inventories to the extent feasible. For example, virtual machines can be difficult to monitor because such machines can obt visible to the network when not in use. In such cases, organizations maintain as up-to-date, complete, and accurate an inventory as is deemed reasonable. Automated maintenance can be achieved by the implementation of CM-2(2) for organizations that combine system component inventory and baseline configuration activities.	
CM-8 (3)	2	Configuration Management System Component Inventory Automated Unauthorized Component Detection	(a) Detect the presence of unauthorized hardware, software, and firmware components within the system using [Assignment: organization-defined automated mechanisms] [Assignment: organization-defined frequency]; and (b) Take the following actions when unauthorized components are detected: [Selection (one or move): disable network access by such components; isolate the components; notify [Assignment: organization-defined personnel or roles]].	unauthorized remote connections and mobile devices. Monitoring for unauthorized system	AC-19, CA-7, RA-5, SC-3, SC-39, SC-44, SI- 3, SI-4, SI-7
CM-8 (4)	2	Configuration Management System Component Inventory Accountability Information	Include in the system component inventory information, a means for identifying by [Selection (one or more): name; position; role], individuals responsible and accountable for administering those components.	Identifying individuals who are responsible and accountable for administering system components ensures that the assigned components are properly administered and that arganizations can contact those individuals if some action is required, for example, the component is determined to be the source of a breach; the component needs to be recalled or replaced; or the component needs to be relocated.	

Control ID	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls	Notes
CM-8 (5)	2	Configuration Management System Component Inventory No Duplicate Accounting of Components	(a) Verify that all components within the system are not duplicated in other system component inventories; or (b) If a centralized component inventory is used, verify components are not assigned to multiple systems.	Preventing duplicate accounting of system components addresses the lack of accountability that occurs when component ownership and system association is not known, especially in large or complex connected systems. For software inventory, centrally imanaged software that is accessed via other systems is addressed as a component of the system on which it is installed and managed. Software installed on multiple organizational systems and managed at the system iteration in the size of the control of the system is stated on the system is set of the system which it is a state of the system which is a state of the system is stated or each individual system and may appear more than once in a centralized component inventory, necessitating a system association for each software instance in the centralized inventory to avoid duplicate accounting of components. Scanning systems implementing multiple network protocols (e.g., IPV and IPVG) can result in duplicate components being identified in different address spaces. The implementation of CM-8(7) can help to eliminate duplicate accounting of components.	masted controls	
CM-8 (6)	2	Configuration Management System Component Inventory Assessed Configurations and Approved Deviations	Include assessed component configurations and any approved deviations to current deployed configurations in the system component inventory.	Assessed configurations and approved deviations focus on configuration settings established by organizations for system components, the specific components that have been assessed to determine compliance with the required configuration settings, and any approved deviations from established configuration settings.		
CM-8 (7)	2	Configuration Management System Component Inventory Centralized Repository	Provide a centralized repository for the inventory of system components.	Organizations may implement centralized system component inventories that include components from all arganizational systems. Centralized repositories of component inventories provide appartunities of efficiencies in accounting for organizational handware, software, and firmware assets. Such repositories may also help organizations rapidly identify the location and responsible individuals of components that have been compromised, breached, or are otherwise in need of mitigation actions. Organizations ensure that the resulting centralized inventories include system-specific information required for proper component accountability.		
CM-8 (8)		Configuration Management System Component Inventory Automated Location Tracking	Support the tracking of system components by geographic location using [Assignment: organization-defined automated mechanisms].	The use of automated mechanisms to track the location of system components can increase the accuracy of component inventories. Such capability may help organizations rapidly identify the location and responsible individuols of system components that have been compromised, breached, or are otherwise in need of mitigation actions. The use of tracking mechanisms can be coordinated with senior agency officials for privacy if there are implications offecting individual privacy.		
CM-8 (9)		Configuration Management System Component Inventory Assignment of Components to Systems	(a) Assign [Assignment: organization-defined acquired system components] to a system; and (b) Receive an acknowledgement from [Assignment: organization-defined personnel or roles] of this assignment.	Organizations determine the types of system components that are subject to this control enhancement.		
cm-9	1	Configuration Management Configuration Management Plan	Develop, document, and implement a configuration management plan for the system that: a. Addresses roles, responsibilities, and configuration management processes and procedures; b. Establishes a process for identifying configuration items throughout the system development life cycle and for managing the configuration of the configuration items; c. Defines the configuration tems for the system and places the configuration items under configuration management; d. is reviewed and approved by [Assignment: organization-defined personnel or roles]; and e. Protects the configuration management plan from unauthorized disclosure and modification.	As such, there are developmental configuration management activities (e.g., the control of	CM-2, CM-3, CM-4, CM-5, CM-8, PL-2, SA- 10, SI-12	
CM-9 (1)		Configuration Management Configuration Management Plan Assignment of Responsibility	Assign responsibility for developing the configuration management process to organizational personnel that are not directly involved in system development.	aganizations, system developers may be tasked to develop configuration management processes using personnel who are not directly involved in system development or system integration. This separation of duties ensures that arganizations establish and maintain a sufficient degree of independence between the system development and integration processes and configuration management processes to facilitate quality control and more effective oversight.		
CM-10	1	Configuration Management Software Usage Restrictions	a. Use software and associated documentation in accordance with contract agreements and copyright laws; b. Track the use of software and associated documentation protected by quantity licenses to control copying and distribution; and c. Control and document the use of peer-to-peer file sharing technology to ensure that this capability is not used for the unauthorized distribution, display, performance, or reproduction of copyrighted work.	depending on organizational needs. A non-disclosure agreement is an example of a contract agreement.	AC-17, AU-6, CM-7, CM-8, SC-7	
CM-10 (1)	2	Configuration Management Software Usage Restrictions Open Source Software	Establish the following restrictions on the use of open source software: [Assignment: organization-defined restrictions].	Open source software refers to software that is available in source code form. Certain software rights normally reserved for copylight holders are routnely provided under software rights are government that permit individuals to study, change, and improve the software. From a security perspective, the major advantage of open source software is that it provides cognitionalisms with the ability to examine the source code. However, remediating vulnerabilities in open source software may be problematic. There may also be licensing issues associated with open source software, including the constraints on derivative use of such software. Open source software that is available only in binary form may increase the level of risk in using such software.	SI-7	

CM-11 (1)	1 2	Configuration Management User-installed Software Withdrawn User-installed Software Configuration Management User-installed Software X	Control Text a. Establish [Assignment: organization-defined policies] governing the installation of software by users; b. Enforce software installation policies through the following methods: [Assignment: organization-defined methods]; and c. Monitor policy compliance [Assignment: organization-defined frequency].	Discussion If provided the necessary privileges, users can install software in organizational systems. To maintain control over the software installed, organizations identify permitted and prohibited actions regarding software installation. Permitted software installations include updates and security patches to existing software and downloading one applications from organization-approved "app stores." Prohibited software installations include software with unknown or suspect pedigrees or software that organizations consider potentially malicious. Policies selected for governing user-installed software are organization-developed or provided by some external entity. Policy enforcement methods can include procedural methods and automated methods.	Related Controls AC-3, AU-6, CM-2, CM-3, CM-5, CM-6, CM-7, CM-8, PL-4, SI- 7	Notes [Withdrawn: Incomprated into CM-8 (3)]
CIVI-11 (1)	- 2	Alerts for Unauthorized Installations				[withurawn: incorporated into civi-8 [3]]
CM-11 (2)	2	Configuration Management User-installed Software Software Installation with Privileged Status	Allow user installation of software only with explicit privileged status.	Privileged status can be obtained, for example, by serving in the role of system administrator.	AC-5, AC-6	
CM-12	1	Configuration Management Information Location	a. Identify and document the location of [Assignment: organization-defined information] and the specific system components on which the information is processed and stored; b. Identify and document the users who have access to the system and system components where the information is processed and stored; and c. Document changes to the location (i.e., system or system components) where the information is processed and stored.	processed and stored. Information location includes identifying where specific information types and associated information reside in the system components; and how information is being processed so that information flow can be understood, and adequate protection and		
CM-12 (1)	2	Configuration Management Information Location Automated Tools to Support Information Location	Use automated tools to identify [Assignment: organization-defined information by information type] on [Assignment: organization-defined system components] to ensure controls are in place to protect organizational information and individual privacy.	The use of automated tools helps to increase the effectiveness and efficiency of the information location capability implemented within the system. Automation also helps arganizations amonge the data produced during information location activities and share such information organization-wide. The output of automated information location tools can be used to guide and inform system architecture and design decisions.		
CM-13	1	Configuration Management Data Action Mapping	Develop and document a map of system data actions.		CM-4, CM-12, PM-5, PM-27	
CP		Contingency Planning				
CP-1	1	Contingency Planning Policy and Procedures	a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]. [J. [Selection (noe or more]: organization-level; mission/business process-level; system-level] contingency planning policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entitles, and compliance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the contingency planning policy and the associated contingency planning controls; D. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the contingency planning policy and procedures; and C. Review and update the current contingency planning: 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the CP family implemental within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and privacy assurance. Therefore, it is important that security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy programs and for systems, if needed. Procedures describe how the policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.	PM-9, PS-8, SI-12	
CP-2	1	Contingency Planning Contingency Plan	a. Develop a contingency plan for the system that: 1. Identifies essential missions and business functions and associated contingency requirements; 2. Provides recovery objectives, restoration priorities, and metrics; 3. Addresses contingency roles, responsibilities, assigned individuals with contact information; 4. Addresses maintaining essential missions and obusiness functions despite a system disruption, compromise, or failure; 5. Addresses eventual, full system restoration without deterioration of the controls originally planned and implemented; and 6. Is reviewed and approved by [Assignment: organization-defined personnel or roles]; b. Distribute copies of the contingency plan to [Assignment: organization-defined key contingency personnel (identified by name and/or by role) and organizational elements); c. Coordinate contingency planing activities with incident handling activities; d. Review the contingency plan for the system [Assignment: organization-defined frequency]; e. Update the contingency plan oddress changes to the organization-defined device on immense of persistion and problems encountered during contingency plan implementation, execution, or testing; f. Communicate contingency plan changes to [Assignment: organization-defined key contingency personnel (identified by name and/or by role) and organizational elements]; and g. Protect the contingency plan from unauthorized disclosure and modification.	operations for organizational missions and business functions. Contingency planning addresses system restoration and implementation of alternative mission or business processes when systems are compromised or breached. Contingency planning is considered throughout the system development life cycle and is a fundamental part of the system design. Systems can be designed for redundancy, to provide backup capabilities, and for resilience. Contingency plans reflect the degree of restoration required for organizational	(P-3, CP-4, CP-6, CP-7, CP-8, CP-9, CP-7, CP-8, CP-9, CP-13, IR-4, IR-6, IR-8, IR-9, MA-6, MP-2, MP-4, MP-2, MP-4, MP-2, MP-4,	
CP-2 (1)	2	Contingency Planning Contingency Plan Coordinate with Related Plans	Coordinate contingency plan development with organizational elements responsible for related plans.	Plans that are related to contingency plans include Business Continuity Plans, Disaster Recovery Plans, Critical Infrastructure Plans, Continuity of Operations Plans, Crisis Communications Plans, Insider Threat Implementation Plans, Cyber Incident Response Plans, and Occupant Emergency Plans.		

CombustID	t accord	Control Name	Control Tort	Plantalan	Deleted Controls	Notes
CP-2 (2)	2	Control Name Withdra Contingency Plan Copacity Planning Contingency Plan Copacity Planning	Control Text Conduct capacity planning so that necessary capacity for information processing, telecommunications, and environmental support exists during contingency operations.	Cleanisty planning is needed because different threats can result in a reduction of the available processing, telecommunications, and support services intended to support essential missions and business functions. Organisations anticipate depraded operations during contingency operations and factor the degradation into capacity planning. For capacity planning, environmental support refers to any environmental factor for which the organization determines that it needs to provide support in a contingency situation, even if in a degraded state. Such determinations are based on an arganisational assessment of risk, system categorization (impact level), and organizational risk tolerance.	Related Controls PE-11, PE-12, PE-13, PE-14, PE-18, SC-5	Notes
CP-2 (3)	2	Contingency Planning Contingency Plan Resume Missions and Business Functions	Plan for the resumption of [Selection: all; essential] missions and business functions within [Assignment: organization-defined time-period] of contingency plan activation.	Organizations may choose to conduct contingency planning activities to resume missions and business functions as part of business continuity planning or as part of business impact analyses. Organizations prioritize the resumption of missions and business functions. The time-period for the resumption of missions and business functions may be dependent on the severity and extent of the disruptions to the system and its supporting infrastructure.		
CP-2 (4)	2	Contingency Planning Contingency Plan Resume	X			[Withdrawn: Incorporated into CP-2 (3)]
CP-2 (5)	2	All Missions and Business Functions Contingency Planning Contingency Plan Continue Missions and Business Functions	Plan for the continuance of [Selection: all; essential] missions and business functions with minimal or no loss of operational continuity and sustains that continuity until full system restoration at primary processing and/or storage sites.	Organizations may choose to conduct the contingency planning activities to continue missions and business functions as part of business continuity planning or as part of business impact analyses. Primary processing and/or storage sites defined by organizations as part of contingency planning may change depending on the circumstances associated with the contingency.		
CP-2 (6)	2	Contingency Planning Contingency Plan Alternate Processing and Storage Sites	Plan for the transfer of [Selection: all; essential] missions and business functions to alternate processing and/or storage sites with minimal or no loss of operational continuity and sustain that continuity through system restoration to primary processing and/or storage sites.	Organizations may choose to conduct the contingency planning activities for alternate processing and storage sites as part of business continuity planning or as part of business impact analyses. Primary processing and/or storage sites defined by organizations as part of contingency planning may change depending on the circumstances associated with the contingency.		
CP-2 (7)	2	Contingency Planning Contingency Plan Coordinate with External Service Providers	Coordinate the contingency plan with the contingency plans of external service providers to ensure that contingency requirements can be satisfied.	When the capability of an organization to carry out its missions and business functions is dependent on external service providers, developing a comprehensive and timely contingency plan may become more challenging. When missions and business functions are dependent on external service providers, organizations coordinate contingency planning activities with the external entities to ensure that the individual plans reflect the overall contingency needs of the organization.	SA-9	
CP-2 (8)	2	Contingency Planning Contingency Plan Identify Critical Assets	identify critical system assets supporting [Selection: all; essential] missions and business functions.	Organizations may choose to identify critical assets as part of criticality analysis, business continuity planning, or business impact analyses. Organizations identify critical system assets as additional controls can be employed (beyond the controls routinely implemented) to help ensure that arganizational missions and business functions can continue to be conducted during contingency operations. The identification of critical information assets also facilitates the prioritization of arganizational resources. Critical system assets include technical and operational aspects. Technical aspects include system components, information technology services, information technology products, and mechanisms. Operational aspects included procedures (manually executed operations) and personnel (individuals operating technical controls and/or executing manual procedures). Organizational program protection plans can assist in identifying critical assets, if critical assets are resident within or supported by external service providers, organizations consider implementing CP-2(7) as a control enhancement.	CM-8, RA-9	
CP-3	1	Contingency Planning Contingency Training	Provide contingency training to system users consistent with assigned roles and responsibilities: a. Within [Assignment: organization-defined time-period] of assuming a contingency role or responsibility; b. When required by system changes; and c. [Assignment: organization-defined frequency] thereafter.	Contingency training provided by organizations is linked to the assigned roles and responsibilities of organizational personnel to ensure that the appropriate content and level of detail is included in such training. For example, some individuals may only need to know when and where to report for duty during contingency operations and if normal duties are affected; system administrators may require additional training on how to establish systems at alternate processing and storage sites; and organizational officials may receive more specific training on how to conduct mission-essential functions in designated off-site locations and how to establish communications with other governmental entities for purposes of coordination on contingency-related activities. Training for contingency roles or responsibilities reflects the specific continuity requirements in the contingency plan.	4, IR-9	
CP-3 (1)	2	Contingency Planning Contingency Training Simulated Events	Incorporate simulated events into contingency training to facilitate effective response by personnel in crisis situations.	The use of simulated events creates an environment for personnel to experience actual threat events including yoken-attacks that disable web sites, ransom-ware attacks that encrypt organizational data on servers, hurricones that damage or destroy organizational facilities, or hardware or software failures.		
CP-3 (2)	2	Contingency Planning Contingency Training Mechanisms Used in Training Environments	Employ mechanisms used in operations to provide a more thorough and realistic contingency training environment.	Operational mechanisms refer to processes that have been established to accomplish an organizational goal or a system that supports a particular organizational mission or business objective. Actual mission/business processes, systems, and/or facilities may be used to generate simulated events and/or to enhance the realism of simulated events during contingen; training.		
CP-4	1	Contingency Planning Contingency Plan Testing	a. Test the contingency plan for the system [Assignment: organization-defined frequency] using the following tests to determine the effectiveness of the plan and the readiness to execute the plan: [Assignment: organization-defined tests]. b. Review the contingency plan test results, and c. Initiate corrective actions, if needed.	Methods for testing contingency plans to determine the effectiveness of the plans and to identify potential weaknesses in the plans include checklists, walk-through and tabletop exercises, simulations (parallel or full interrupt), and comprehensive exercises. Organizations conduct testing based on the requirements in contingency plans and include a determination of the effects on organizational operations, assets, and individuals due to contingency operations. Organizations have flexibility and discretion in the breadth, depth, and timelines of corrective actions.	AT-3, CP-2, CP-3, CP- 8, CP-9, IR-3, IR-4, PL- 2, PM-14, SR-2	
CP-4 (1)	2	Contingency Planning Contingency Plan Testing Coordinate with Related Plans	Coordinate contingency plan testing with organizational elements responsible for related plans.	Plans related to contingency planning for organizational systems include Business Continuity Plans, Disaster Recovery Plans, Continuity of Operations Plans, Crisis Communications Plans, Crisis Infrastructure Plans, Cyber Incident Response Plans, and Occupant Emergency Plans. Coordination of contingency plan testing does not require organizations to create organizational elements to handle related plans or to align such elements with specific plans. It does require, however, that if such organizational elements are responsible for related plans, organizations coordinate with those elements.	IR-8, PM-8	
CP-4 (2)	2	Contingency Planning Contingency Plan Testing Alternate Processing Site	Test the contingency plan at the alternate processing site: (a) To familiarize contingency personnel with the facility and available resources; and (b) To evaluate the capabilities of the alternate processing site to support contingency operations.	conditions at the alternate pracessing site may be significantly different than the conditions at the primary site. Having the opportunity to visit the alternate site and experience, firsthand, the actual capabilities available at the site can provide valuable information on potential vulnerabilities that could affect essential organizational missions and functions. The on-site visit can also provide an opportunity to refine the contingency plan to address the vulnerabilities discovered during testing.	CP-7	

Control ID	Level	Control Name Wi	ithdrawn	Control Text	Discussion	Related Controls	Notes
CP-4 (3)	2	Contingency Planning Contingency Plan Testing		Test the contingency plan using [Assignment: organization-defined automated mechanisms].	Automated mechanisms facilitate thorough and effective testing of contingency plans by	ANGLES MITTOR	
		Automated Testing			providing more complete coverage of contingency issues; by selecting more realistic test scenarios and environments; and by effectively stressing the system and supported missions and business operations.		
CP-4 (4)	2	Contingency Planning Contingency Plan Testing Full Recovery and Reconstitution		include a full recovery and reconstitution of the system to a known state as part of contingency plan testing.	Recovery is executing contingency plan activities to restore organizational missions and business functions. Reconstitution takes place following recovery and includes activities for returning systems to fully operational states: Organizations establish a hown state for systems that includes system state information for hardware, software programs, and data. Preserving system state information facilitates system restart and return to the operational mode of organizations with less disruption of mission and business processes.	CP-10, SC-24	
CP-5	1	Contingency Planning Contingency Plan Update	Х				[Withdrawn: Incorporated into CP-2]
CP-6	1	Contingency Planning Alternate Storage Site		a. Establish an alternate storage site, including necessary agreements to permit the storage and retrieval of system backup information; and b. Ensure that the alternate storage site provides controls equivalent to that of the primary site.		CP-2, CP-7, CP-8, CP- 9, CP-10, MP-4, MP- 5, PE-3, SC-36, SI-13	
CP-6 (1)	2	Contingency Planning Alternate Storage Site Separation from Primary Site		identify an alternate storage site that is sufficiently separated from the primary storage site to reduce susceptibility to the same threats.	Threat shat affect alternate storage sites are defined in organizational risk assessments and include natural disasters, structural failures, hostile attacks, and errors of amission or commission. Organizations determine what is considered a sufficient degree of separation between primary and alternate storage sites based on the types of threats that are of concern. For threats such as hostile attacks, the degree of separation between sites is less relevant.	RA-3	
CP-6 (2)	2	Contingency Planning Alternate Storage Site Recovery Time and Recovery Point Objectives		Configure the alternate storage site to facilitate recovery operations in accordance with recovery time and recovery point objectives.	Organizations establish recovery time and recovery point objectives as part of contingency planning. Configuration of the alternate storage site includes physical facilities and the systems supporting recovery operations ensuring accessibility and correct execution.		
CP-6 (3)	2	Contingency Planning Alternate Storage Site Accessibility		identify potential accessibility problems to the alternate storage site in the event of an area-wide disruption or disaster and outline explicit mitigation actions.	Areo-wide disruptions refer to those types of disruptions that are broad in geographic scope with such determinations made by organizations based on organizational assessments of risk. Explicit mitigation actions include duplicating backup information at other alternate storage sites if access problems occur at originally designated alternate sites; or planning for physical access to retrieve backup information if electronic accessibility to the alternate site is disrupted.		
:P-7	1	Contingency Planning Alternate Processing Site		a. Establish an alternate processing site, including necessary agreements to permit the transfer and resumption of fassignment: organization-defined system operations] for essential missions and business functions within [Assignment: organization-defined time-period consistent with recovery time and recovery point objectives] when the primary processing capabilities are unavailable; b. Make available at the alternate processing site, the equipment and supplies required to transfer and resume operations or put contracts in place to support delivery to the site within the organization-defined time-period for transfer and resumption; and c. Provide controls at the alternate processing site that are equivalent to those at the primary site.	sites and provide processing capability if the primary processing site is not available. The alternate processing capability may be addressed using a physical processing site or other	CP-2, CP-6, CP-8, CP-9, CP-10, MA-6, PE-3, PE-11, PE-12, PE-17, SC-36, SI-13	
CP-7 (1)	2	Contingency Planning Alternate Processing Site Separation from Primary Site		identify an alternate processing site that is sufficiently separated from the primary processing site to reduce susceptibility to the same threats.	Threats that affect alternate processing sites are defined in organizational assessments of risk and include natural disosters, structural failures, hostile attacks, and errors of amission or commission. Organizations determine what is considered a sufficient degree of separation between primary and alternate processing sites based on the types of threats that are of concern. For threats such as hostile attacks, the degree of separation between sites is less relevant.	RA-3	
CP-7 (2)	2	Contingency Planning Alternate Processing Site Accessibility		Identify potential accessibility problems to alternate processing sites in the event of an area-wide disruption or disaster and outlines explicit mitigation actions.	Area-wide disruptions refer to those types of disruptions that are broad in geographic scope with such determinations made by organizations based on organizational assessments of risk.	RA-3	
CP-7 (3)	2	Contingency Planning Alternate Processing Site Priority of Service		Develop alternate processing site agreements that contain priority-of-service provisions in accordance with availability requirements (including recovery time objectives).	Priority-of-service agreements refer to negotiated agreements with service providers that ensure that arganizations receive priority treatment consistent with their availability requirements and the availability of information resources for logical otherante processing and/or at the physical alternate processing site. Organizations establish recovery time objectives as part of contingency planning.		
CP-7 (4)	2	Contingency Planning Alternate Processing Site Preparation for Use		Prepare the alternate processing site so that the site can serve as the operational site supporting essential missions and business functions.		CM-2, CM-6, CP-4	
CP-7 (5)	2	Contingency Planning Alternate Processing Site Equivalent Information Security Safeguards	х				[Withdrawn: Incorporated Into CP-7]
CP-7 (6)		Contingency Planning Alternate Processing Site Inability to Return to Primary Site		Plan and prepare for circumstances that preclude returning to the primary processing site.	There may be situations that preclude an organization from returning to the primary processing site. This can occur, for example, if a natural disaster such as a flood or a hurricane damaged or destroyed a facility and it was determined that rebuilding in the same location was not prudent.		
P-8	1	Contingency Planning Telecommunications Services		Establish alternate telecommunications services, including necessary agreements to permit the resumption of [Assignment: organization-defined system operations] for essential missions and business functions within [Assignment: organization-defined time-period] when the primary telecommunications capabilities are unavailable at either the primary or alternate processing or storage sites.		CP-2, CP-6, CP-7, CP- 11, SC-7	

Control ID	Louis	Control Name W	Vithdrawn	Control Text	Discouries	Related Controls	Makes
CP-8 (1)	2	Contingency Planning Telecommunications Services Priority of Service Provisions		(a) Develop primary and alternate telecommunications service agreements that contain priority-of-service provisions in accordance with availability requirements (including recovery time objectives); and (b) Request Telecommunications service such for national security emergency preparedness if the primary and/or alternate telecommunications services are provided by a common carrier.	Organizations consider the potential mission or business impact in situations where telecommunications service providers are servicing other organizations with similar priority-of-service provisions. Telecommunications Service priority (TSP) is a Federal Communications Commission (FCC) program that directs telecommunications service providers (e.g., wireline and wireless phone companies) to give preferential treatment to users enrolled in the program when they need to add new lines or how their lines restored following a disruption of service, regardless of the cause. The FCC sets the rules and policies for the TSP program and the Department of Homeland Security, manages the TSP program. The TSP program is always in effect and not contingent on a major disaster or attack taking place. Federal sponsorship is required to enroll in the TSP program.	Reared Controls	NOCES
CP-8 (2)	2	Contingency Planning Telecommunications Services Single Points of Failure		Obtain alternate telecommunications services to reduce the likelihood of sharing a single point of failure with primary telecommunications services.	In certain circumstances, telecommunications service providers or services may share the same physical lines, which increases the vulnerability of a single failure point. It is important to have provider transparency for the actual physical transmission capability for telecommunication services.		
CP-8 (3)	2	Contingency Planning Telecommunications Services Separation of Primary and Alternate Providers		Obtain alternate telecommunications services from providers that are separated from primary service providers to reduce susceptibility to the same threats.	Threats that affect telecommunications services are defined in organizational assessments of risk and include natural disasters, structural failures, cyber or physical attacks, and errors of omission or commission. Organizations can reduce common susceptibilities by minimizing shared infrastructure among telecommunications service providers and achieving sufficient geographic separation between services. Organizations may consider using a single service provider in situations where the service provider can provide alternate telecommunications services meeting the separation needs addressed in the risk assessment.		
CP-8 (4)	2	Contingency Planning Telecommunications Services Provider Contingency Plan		(a) Require primary and alternate telecommunications service providers to have contingency plans; (b) Review provider contingency plans to ensure that the plans meet organizational contingency requirements; and (c) Obtain evidence of contingency testing and training by providers [Assignment: organization-defined frequency].	Reviews of provider contingency plans consider the proprietary nature of such plans. In some situations, a summary of provider contingency plans may be sufficient evidence for organizations to satisfy the review requirement. Telecommunications service providers may also participate in ongoing disaster recovery exercises in coordination with the Department of Homeland Security, state, and local governments. Organizations may use these types of activities to satisfy evidentiary requirements related to service provider contingency plan reviews, testing, and training.	CP-3, CP-4	
CP-8 (5)	2	Contingency Planning Telecommunications Services Alternate Telecommunication Service Testing		Test alternate telecommunication services [Assignment: organization-defined frequency].	Alternate telecommunications services testing is arranged through contractual agreements with service providers. The testing may occur in parallel with normal operations to ensure there is no degradation in organizational missions or functions.	CP-3	
CP-9	1	Contingency Planning System Backup		a. Conduct backups of user-level information contained in [Assignment: organization-defined system components] [Assignment: organization-defined frequency consistent with recovery time and recovery point objectives]; b. Conduct backups of system-level information contained in the system [Assignment: organization-defined frequency consistent with recovery time and recovery point objectives]; c. Conduct backups of system documentation, including security and privacy-related documentation [Assignment: organization-defined frequency consistent with recovery time and recovery point objectives]; and d. Protect the confidentiality, integrity, and availability of backup information.	middleware, application software, and licenses. User-level information includes information	CP-2, CP-6, CP-10, MP-4, MP-5, SC-13, SI-4, SI-13	
CP-9 (1)	2	Contingency Planning System Backup Testing for Reliability and Integrity		Test backup information [Assignment: organization-defined frequency] to verify media reliability and information integrity.	Organizations need assurance that backup information can be reliably retrieved. Reliability pertains to the systems and system components where the backup information is stored, the operations used to retrieve the information, and the integrity of the information being retrieved. Independent and specialized tests can be used for each of the aspects of reliability. For example, decrypting and transporting (or transmitting) a random sample of backup files from the alternate storage or backup site and companing the information to the same information at the primary processing site can provide such assurance.	CP-4	
CP-9 (2)	2	Contingency Planning System Backup Test Restoration Using Sampling		Use a sample of backup information in the restoration of selected system functions as part of contingency plan testing.	Organizations need assurance that system functions can be restored correctly and can support established organizational missions. To ensure that the selected system functions are thoroughly exercised during contingency plan testing, a sample of backup information is used to determine if the functions operate as intended. Organizations can determine the sample size for the functions and backup information based on the level of assurance needed.	CP-4	
CP-9 (3)	2	Contingency Planning System Backup Separate Storage for Critical Information		Store backup copies of [Assignment: organization-defined critical system software and other security-related information] in a separate facility or in a fire-rated container that is not collocated with the operational system.	Separate storage for critical information applies to all critical information regardless of the type of backup storage media. Critical system software includes operating systems, middleware, cryptographic key monagement systems, and intrusion detection systems. Security-related information includes inventories of system hardware, software, and firmware components. Alternate storage sites, including geographically distributed architectures, serve as separate storage facilities for organizations. Organizations may provide separate storage by implementing automated backup processes at alternative storage sites (e.g. data centers.) The General Services Administration (GSA) establishes standards and specifications for security and fire-rated containers.	CM-2, CM-6, CM-8	
CP-9 (4)	2	Contingency Planning System Backup Protection	X				[Withdrawn: Incorporated into CP-9]
CP-9 (5)	2	from Unauthorized Modification Contingency Planning System Backup Transfer to Alternate Storage Site		Transfer system backup information to the alternate storage site [Assignment: organization-defined time-period and transfer rate consistent with the recovery time and recovery point objectives].	System backup information can be transferred to alternate storage sites either electronically or by physical shipment of storage media.	CP-7, MP-3, MP-4, MP-5	
CP-9 (6)	2	Contingency Planning System Backup Redundant Secondary System		Conduct system backup by maintaining a redundant secondary system that is not collocated with the primary system and that can be activated without loss of information or disruption to operations.	The effect of system backup can be achieved by maintaining a redundant secondary system that mimors the primary system, including the replication of information. If this type of redundancy is in place and there is sufficient geographic separation between the two systems, the secondary system can also serve as the alternate processing site.		
CP-9 (7)	2	Contingency Planning System Backup Dual Authorization		Enforce dual authorization for the deletion or destruction of [Assignment: organization-defined backup Information].	Dual authorization ensures that deletion or destruction of backup information cannot occur unless two qualified individuals carry out the task. Individuals deleting or destroying backup information possess the skills or expertise to determine if the proposed deletion or destruction of information reflects organizational policies and procedures. Dual authorization may also be known as two-person control. To reduce the risk of collusion, organizations consider rotating dual authorization duties to other individuals.	AC-3, AC-5, MP-2

	2	Cryptographic Protection	organization-defined backup information].	confidentiality and integrity of backup information. The strength of mechanisms selected is commensurate with the security category or classification of the information. This control enhancement applies to system backup information in storage at primary and alternate locations. Organizations implementing cryptographic mechanisms to protect information at rest also consider cryptographic key management solutions.		
CP-10	1	Contingency Planning System Recovery and Reconstitution	Provide for the recovery and reconstitution of the system to a known state within [Assignment: organization-defined time-period consistent with recovery time and recovery point objectives] after a disruption, compromise, or failure.	Recovery is executing contingency plan activities to restore organizational missions and business functions. Reconstitution takes place following recovery and includes activities for returning systems to fully operational states. Recovery and reconstitution operations reflect mission and business priorities, recovery topint, recovery time, and reconstitution objectives, and organizational metrics consistent with contingency plan requirements. Reconstitution includes the deactivation of interim system capabilities that may have been needed during recovery operations. Reconstitution also includes assessments of fully restored system capabilities, restablishment of continuous monitoring activities, system reauthorization (if required), and activities to prepare the system and organization for future disruptions, breaches, compromises, or failures. Recovery and reconstitution capabilities can include automated mechanisms and manual procedures. Organizations establish recovery time and recovery point objectives as part of contingency planning.		
CP-10 (1)	2	Reconstitution Contingency Plan Testing	X			[Withdrawn: Incorporated into CP-4]
CP-10 (2)	2	Contingency Planning System Recovery and Reconstitution Transaction Recovery	Implement transaction recovery for systems that are transaction-based.	Transaction-based systems include database management systems and transaction processing systems. Mechanisms supporting transaction recovery include transaction rollback and transaction journaling.		
CP-10 (3)	2	Contingency Planning System Recovery and Reconstitution Compensating Security Controls	X Addressed through tailoring procedures.			[Withdrawn: Addressed through tailoring]
CP-10 (4)	2	Contingency Planning System Recovery and Reconstitution Restore Within Time-period	Provide the capability to restore system components within [Assignment: organization-defined restoration time- periods] from configuration-controlled and integrity-protected information representing a known, operational state for the components.	Restoration of system components includes reimaging which restores the components to known, operational states.	CM-2, CM-6	
CP-10 (5)	2	Contingency Planning System Recovery and Reconstitution Failover Capability	X			[Withdrawn: Incorporated into SI-13]
CP-10 (6)	2	Contingency Planning System Recovery and	Protect system components used for recovery and reconstitution.	Protection of system recovery and reconstitution components (i.e., hardware, firmware, and	AC-3, AC-6, MP-2,	
		Reconstitution Component Protection		software) includes physical and technical controls. Backup and restoration components used for recovery and reconstitution include router tables, compilers, and other system software.	MP-4, PE-3, PE-6	
CP-11	1	Contingency Planning Alternate Communications Protocols	Provide the capability to employ [Assignment: organization-defined alternative communications protocols] in support of maintaining continuity of operations.	Contingency plans and the contingency training or testing associated with those plans, incorporate an alternate communications protocol capability as part of establishing resilience in organizational systems. Switching communications protocols may affect software applications and operational aspects of systems. Organizations assess the potential side effects of introducing alternate communications protocols prior to implementation.	CP-2, CP-8, CP-13	
CP-12	1	Contingency Planning Safe Mode	When [Assignment: organization-defined conditions] are detected, enter a safe mode of operation with [Assignment: organization-defined restrictions of safe mode of operation].	For systems supporting critical missions and business functions, including military operations, civilian space operations, nuclear power plant operations, and air traffic control operations (especially real-time operational environments), organizations can identify certain conditions under which those systems revert to a predefined safe mode of operation. The safe mode of operation, which can be activated either automatically or manually, restricts the operations systems can execute when those conditions are encountered. Asstriction includes allowing only selected functions to execute that can be carried out under limited power or with reduced communications bandwidth.	CM-2, SA-8, SC-24, SI- 13, SI-17	
CP-13	1	Contingency Planning Alternative Security Mechanisms	Employ [Assignment: organization-defined alternative or supplemental security mechanisms] for satisfying [Assignment: organization-defined security functions] when the primary means of implementing the security function is unavailable or compromised.	Use of alternative security mechanisms supports system resiliency, contingency planning, and continuity of operations. To ensure mission and business continuity, organizations can implement alternative or supplemental security mechanisms. The mechanisms may be less effective than the primary mechanisms. However, having the capability to readily employ alternative or supplemental mechanisms enhances mission and business continuity that might otherwise be adversely impacted if operations had to be curtailed until the primary means of implementing the functions was restored. Given the cost and level of effort required to provide such alternative capabilities, the alternative or supplemental mechanisms are typically applied only to critical security capabilities provided by systems, system components, or system services. For example, an organization may issue to senior executives and system administrators one-time pads if multifactor tokens, the standard means for secure remote authentication, is compromised.	CP-2, CP-11, SI-13	
CP-14	1	Contingency Planning Self-challenge	Employ [Assignment: organization-defined autonomous service] to [Assignment: organization-defined system o system components] to affect the system or system components in an adverse manner.	Often the best means of assessing the effectiveness of the controls implemented within a system and the system resilience is to disrupt it in some maner. The autonomous service selected and implemented by the organization could disrupt system services in many ways, including terminating or disabling key system components, changing the configuration of system elements, altering privilege, or degrading critical functionality (e.g., restricting network bandwidth). Such automated, on-going, simulated cyber-attacks and service disruptions can reveal unexpected functional dependencies and help the organization determine its ability to ensure resilience in the face of an actual cyber-attack.		
IA	0	Identification and Authentication				
IA-1	1	Identification and Authentication Policy and Procedures	a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (neo or more): organization-level; mission/business process-level; system-level] identification and authentication policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and (b) is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the identification and authentication policy and the associated identification and authentication controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the identification and authentication policy and procedures; and c. Review and update the current identification and authentication: 1. Policy [Assignment: organization-defined frequency], 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the IA family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and privacy assurance. Therefore, it is important that security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy programs and for systems, if needed. Procedures can be established for security and privacy programs and for as the discussion of the procedure of the procedure scan be documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.

Discussion Single sign-on enables users to log in once and gain access to multiple system resources.	Merated Controls	Notes
IA-2 (10)	-	Authentication (organizational Users) Single Sign-on		r torree a single sign-on copounty for presignment, organization-defined system accounts and servicesy.	Single sign-or enables also dough in other term gain cets to multiple system resolutes. Organizations consider the operational efficiencies provided by single sign-on capabilities with the risk introduced by allowing access to multiple systems via a single authentication event. Single sign-on can present opportunities to improve system security, for example by providing the ability to add multiplactor authentication for applications and systems (existing and new) that may not be able to natively support multifactor authentication.		
IA-2 (11)	2	Identification and Authentication Identification and Authentication (organizational Users) Remote Access — Separate Device	Х				[Withdrawn: Incorporated into IA-2 (6)]
IA-2 (12)	2	Identification and Authentication Identification and Authentication (organizational Users) Acceptance of PIV Credentials		Accept and electronically verify Personal Identity Verification-compliant credentials.	Acceptance of Personal Identity Verification (PIV)-compliant credentials applies to organizations implementing logical access control and physical access control systems. PIV- compliant credentials are those credentials issued by federal agencies that conform to FIPS Publication 201 and supporting guidance documents. The adequacy and reliability of PIV card issuers are authorized using ISP 800-79-2]. Acceptance of PIV-compliant credentials includes derived PIV credentials, the use of which is addressed in ISP 800-166]. The DOD Common Access Card (CAC) is an example of a PIV credential.		
IA-2 (13)		identification and Authentication Identification and Authentication (organizational Users) Out-of-band Authentication		implement the following out-of-band authentication mechanisms under (Assignment: organization-defined conditions): [Assignment: organization-defined out-of-band authentication].	out-of-band authentication refers to the use of two separate communication paths to identify and authenticate users or devices to an information system. The first path (i.e., the in-band path), is used to identify and authenticate users or devices, and generally is the path through which information flows. The second path (i.e., the out-of-band path) is used to independently verify the outhentication and/or requested action. For example, a user authenticates was a natebook computer to a remote server to which the user desires access and requests some action of the server win that communication path. Subsequently, the server contacts the user wis the user's cell phone to verify that the requested action originated from the user. The user may confirm the intended action to an individual on the telephone. Our provide an authentication code via the telephone. Our John du authentication can be used to mitigate actual or suspected man-in the-middle attacks. The conditions or criteria for activation can individual can be used to mitigate actual or suspected man-in the-middle ottacks. The conditions or criteria for activation can individual can be used to mitigate actual or suspected man-in the-middle ottacks. The conditions or	IA-10, IA-11, SC-37	
IA-3	1	Identification and Authentication Device Identification and Authentication		Uniquely identify and authenticate [Assignment: organization-defined devices and/or types of devices] before establishing a [Selection (one or more): local; remote; network] connection.	by type, by device, or by a combination of type and device. Organization-defined device	AC-17, AC-18, AC-19, AU-6, CA-3, CA-9, IA- 4, IA-5, IA-9, IA-11, SI- 4	
IA-3 (1)	2	Identification and Authentication Device Identification and Authentication Cryptographic Bidirectional Authentication		Authenticate [Assignment: organization-defined devices and/or types of devices] before establishing [Selection (one or more): local; remote; network] connection using bidirectional authentication that is cryptographically based.	A local connection is any connection with a device communicating without the use of a network. A network connection is any connection with a device that communicates through a network. A remote connection is any connection with a device communicating through an external network. Bidirectional authentication provides stronger protection to validate the identity of other devices for connections that are of greater risk.	SC-8, SC-12, SC-13	
IA-3 (2)	2	Identification and Authentication Device Identification and Authentication Cryptographic Bidirectional Network Authentication	Х				[Withdrawn: Incorporated into IA-3 (1)]
IA-3 (3)	2	Identification and Authentication Device Identification and Authentication Dynamic Address Allocation		(a) Where addresses are allocated dynamically, standardize dynamic address allocation lease information and the lease duration assigned to devices in accordance with [Assignment: organization-defined lease information and lease duration]; and (b) Audit lease information when assigned to a device.	The Dynamic Host Configuration (DHCP) protocol is an example of a means by which clients can dynamically receive network address assignments.	AU-2	
IA-3 (4)		Identification and Authentication Device Identification and Authentication Device Attestation		Handle device identification and authentication based on attestation by [Assignment: organization-defined configuration management process].	configuration and known operating state. Device attestation can be determined via a cryptographic hash of the device. If device attestation is the means of identification and authentication, then it is important that patches and updates to the device are handled via a configuration management process such that the patches and updates are done securely and at the same time do not disrupt the identification and authentication to other devices.	CM-2, CM-3, CM-6	
IA-4	1	Identification and Authentication Identifier Management		Manage system identifiers by: a. Receiving authorization from [Assignment: organization-defined personnel or roles] to assign an individual, group, role, service, or device identifier; b. Selecting an identifier that identifies an individual, group, role, service, or device; c. Assigning the identifier to the intended individual, group, role, service, or device; and d. Preventing reuse of identifiers for [Assignment: organization-defined time-period].	addresses, or device-unique token identifiers. Management of individual identifiers is not applicable to shared system accounts. Typically, individual identifiers are the user names of	PS-3, PS-4, PS-5, SC-	
IA-4 (1)	2	identification and Authentication Identifier Management Prohibit Account Identifiers as Public Identifiers		Prohibit the use of system account identifiers that are the same as public identifiers for individual accounts.	This control enhancement applies to any publicly disclosed account identifier used for communication including, for example, electronic mail and instant messaging. Prohibiting the use of systems account identifiers that are the same as some public identifier such as the Individual identifier section of an electronic mail address, makes it more difficult for adversaries to guests user identifiers. Prohibiting account identifiers as public identifiers without the implementation of other supporting controls and complicates guessing of identifiers. Additional protections are required for authenticators and attributes to protect the account.	AT-2	
IA-4 (2)	2	Identification and Authentication Identifier	Х				[Withdrawn: Incorporated into IA-12 (1)]
IA-4 (3)	2	Management Supervisor Authorization Identification and Authentication Identifier	Х				[Withdrawn: Incorporated into IA-12 (2)]
		Management Multiple Forms of Certification					

Control ID I	lovol	Control Name	ithdrawn	Control Text	Discussion	Related Controls	Notes
IA-4 (4)	2	Identification and Authentication Identifier Management Identify User Status		Control Text Manage individual identifiers by uniquely identifying each individual as [Assignment: organization-defined characteristic identifying individual status].	Discussion Characteristics identifying the status of individuals include contractors and foreign nationals. Identifying the status of individuals by characteristics provides additional information about the people with whom organizational personnel are communicating. For	nerated controls	
					example, it might be useful for a government employee to know that one of the individuals on an email message is a contractor.		
IA-4 (5)	2	identification and Authentication Identifier Management Dynamic Management		Manage individual identifiers dynamically in accordance with [Assignment: organization-defined dynamic identifier policy].	In contrast to conventional approaches to identification that presume static accounts for preregistered users, many distributed systems establish identifiers at run time for entities that were previously unknown. When identifiers are established at runtime for previously unknown entities, organizations can anticipate and provision for the dynamic establishment of identifiers. Pre-established rust relationships and mechanisms with appropriate authorities to validate identities and related credentials are essential.	AC-16	
IA-4 (6)	2	Identification and Authentication Identifier Management Cross-organization Management		Coordinate with the following external organizations for cross-organization management of identifiers: [Assignment: organization-defined external organizations].	Cross-organization identifier management provides the capability to identify individuals, groups, roles, or devices when conducting cross-organization activities involving the processing, storage, or transmission of information.	AU-16, IA-2, IA-5	
IA-4 (7)	2	Identification and Authentication Identifier Management In-person Registration	Х		processing, except, at the second of the sec		[Withdrawn: Incorporated into IA-12 (4)]
IA-4 (8)	2	Identification and Authentication Identifier Management Pairwise Pseudonymous Identifiers		Generate pairwise pseudonymous identifiers.	A pairwise pseudonymous identifier is an apaque unquessable subscriber identifier generated by an identify provider for use at a specific individual relying party. Generating distinct pairwise pseudonymous identifiers, with no identifying information about a subscriber, discourages subscriber activity tracking and profiling beyond the operational requirements established by an organization. The pairwise pseudonymous identifiers are unique to each relying party, except in situations where relying parties can show a demonstrable relationship justifying an operational need for correlation, or all parties consent to being correlated in such a manner.	IA-5	
IA-4 (9)	2	Identification and Authentication Identifier Management Attribute Maintenance and Protection		Maintain the attributes for each uniquely identified individual, device, or service in [Assignment: organization- defined protected central storage].	For each of the entities covered in IA-2, IA-3, IA-8, and IA-9, it is important to maintain the attributes for each authenticated entity on an ongoing basis in a central (protected) store.		
14.5		Identification and Authentication Authenticator Management		h. Protecting authenticator content from unauthorized disclosure and modification; I. Requiring individuals to take, and having devices implement, specific controls to protect authenticators; and I. Changing authenticators for group or role accounts when membership to those accounts changes.	Authenticators include passwords, cryptographic devices, one-time password devices, and key cards. Device authenticators include certificates and passwords. Initial authenticator content is the actual content of the authenticator (e.g., the initial password). In contrast, the requirements about authenticator content contain specific characteristics or criteria (e.g., minimum password length). Developers may deliver system components with factory default authentication credentials to allow for initial installation and configuration. Default authentication credentials are often well known, easily discoverable, and present a significant security risk. The requirement to protect individual authenticators may be implemented via control IP-4. or PS-6 for authenticators in the possession of individuals and by control 8-C-3, A-C-6, and S-C-28 for authenticators stored in organizational systems, including passwords stored in hashed or encrypted formats or files containing encrypted or hashed passwords accessible with administrator privileges. Systems support authenticator management by organization-defined settings and restrictions for various authenticator characteristics (e.g., minimum password length, validation time window for time synchronous one-time tokens, and number of allowed rejections during the verification stage of biometric authentications, Actions can be taken to safeguard individual authenticators, including maintaining possession of authenticators; not sharing authenticators with others; and reporting lost, stolen, or compromised authenticators immediately. Authenticator management includes issuing and revoking authenticators for temporary access when no longer needed.	2, IA-4, IA-7, IA-8, IA- 9, MA-4, PE-2, PL-4	
IA-5 (1)	2	Identification and Authentication Authenticator Management Password-based Authentication		For password-based authentication: (a) Maintain a list of commonly-used, expected, or compromised passwords and update the list [Assignment: organization-defined frequency] and when organizational passwords are suspected to have been compromised directly or indirectly; (b) Verify, when users create or update passwords, that the passwords are not found on the organization-defined list of commonly-used, expected, or compromised passwords; (c) Transmit only cryptagraphically-protected passwords; (d) Store passwords using an approved hash algorithm and salt, preferably using a keyed hash; (e) Require immediate selection of a new password upon account recovery; (f) Allow user selection of long passwords and passhirases, including spaces and all printable characters; (g) Employ outnomated tools to assist the user in selecting strong password authenticators; and (h) Enforce the following composition and complexity rules: [Assignment: organization-defined composition and complexity rules].	Password-based authentication applies to passwords regardless of whether they are used in single-factor or multifactor authentication. Long passwords or passphrases are preferable over shorter passwords. Enforced composition rules provide marginal security benefit while decreasing usability. However, organizations may choose to establish certain rules for passwords generation (e.g., minimum character length for long passwords) under certain circumstances and can enforce this requirement in IA-51J/h). Account recovery can occur, for example, in situations when a password is forgatten. Cryptographically-protected passwords include salted one-way cryptographic hashes of passwords. The list of commonly-used, compromised, or expected passwords includes passwords include salted one-way cryptographic hashes of passwords. The list of commonly-used, compromised, or expected passwords includes passwords obtained from previous breach corpuses, dictionary words, and repetitive or sequential characters. The list includes context specific words, for example, the name of the service, username, and derivatives thereof.	IA-6	
IA-5 (2)	2	identification and Authentication Authenticator Management Implement a local cache of revocation data to support path discovery and validation.		(a) For public key-based authentication: (1) Enforce authorized access to the corresponding private key; and (2) Map the authenticated identity to the account of the individual or group; (b) When public key infrastructure (PK) is used: (1) Validate certificates by constructing and verifying a certification path to an accepted trust anchor, including checking certificate status information; and (2) Implement a local cache of revocation data to support path discovery and validation.	Public key cryptography is a valid authentication mechanism for individuals and machines or devices. When PKI is implemented, status information for certification paths includes certificate revocation lists or certificate status protocol responses. For PIV cards, certificate validation involves the construction and verification of a certification path to the Common Policy Root trust anchor which includes certificate policy processing, implementing a local cache of revocation data to support path discovery and validation supports system availability in situations where organizations are unable to access revocation information via the network.	IA-3, SC-17	
IA-5 (3)	2	Identification and Authentication Authenticator Management In-person or Trusted External Party Realistration	Х				[Withdrawn: Incorporated into IA-12 (4)]
IA-5 (4)	2	Identification and Authentication Authenticator Management Automated Support for Password Strength Determination	Х				[Withdrawn: Incorporated into IA-5 [1]]
IA-5 (5)	2	identification and Authentication Authenticator Management Change Authenticators Prior to Delivery		Require developers and installers of system components to provide unique authenticators or change default authenticators prior to delivery and installation.	Changing authenticators prior to delivery and installation of system components extends the requirement for organizations to change default authenticators upon system installation, by requiring developers and/or installets to provide unique authenticators or change default authenticators for system components prior to delivery and/or installation. However, it typically does not apply to developers of commercial off-the-shelf information technology products. Requirements for unique authenticators can be included in acquisition documents prepared by organizations when procuring systems or system components.		
IA-5 (6)	2	Identification and Authentication Authenticator Management Protection of Authenticators		Protect authenticators commensurate with the security category of the information to which use of the authenticator permits access.	For systems containing multiple security categories of information without reliable physical or logical separation between categories, authenticators used to grant access to the systems are protected commensurate with the highest security category of information on the systems. Security categories of information are determined as part of the security categorization process.	RA-2	

Control ID	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls	Notes
IA-5 (7)	2	Identification and Authentication Authenticator	Ensure that unencrypted static authenticators are not embedded in applications or other forms of static storage.	In addition to applications, other forms of static storage include access scripts and function	Meratigo Controls	Notes

				pattern. Presentation attack detection technologies including liveness detection, can		
				mitigate the risk of these types of attacks by making it difficult to produce artifacts intended		
				to defeat the biometric sensor.		
10.5 (40)	1	Identification and Authoritication Authoritication	(a) Employ (Assignment) organization defined assessed	For those systems where static appropriate are small and the other statics		
IA-5 (18)	2	Identification and Authentication Authenticator Management Password Managers	(a) Employ [Assignment: organization-defined password managers] to generate and manage passwords; and (b) Protect the passwords using [Assignment: organization-defined controls].	For those systems where static passwords are employed, it is often a challenge to ensure that the passwords are suitably complex and that the same passwords are not employed on		
1 1	1	ivianagement Passwora ivianagers	(u) Frotect the passwords using [Assignment: organization-defined controls].	that the passwords are suitably complex and that the same passwords are not employed on multiple systems. A password manager is a solution to this problem as it automatically		
1	1			generates and stores strong and different passwords for the various accounts. A potential		
				risk of using password managers is that adversaries can target the collection of passwords		
1 1	1			generated by the password manager. Therefore, the collection of passwords requires		
1	1			protection including encrypting the passwords (see IA-5(1)d.) and storing the collection off-		
				line in a token.		
	_	Library Control Andrews Control	Observe for the design for the relative before the design of	A shoothat for the different control of the control	46.3	
IA-6	1	Identification and Authentication Authenticator	Obscure feedback of authentication information during the authentication process to protect the information from possible exploitation and use by unauthorized individuals.	Authenticator feedback from systems does not provide information that would allow unauthorized individuals to compromise authentication mechanisms. For some types of	AC-3	
		recupack	nom possible exploitation dilu use by undutionized individuals.	systems, for example, desktops or notebooks with relatively large monitors, the threat		
				(referred to as shoulder surfing) may be significant. For other types of systems, for		
				example, mobile devices with small displays, the threat may be less significant, and is		
				balanced against the increased likelihood of typographic input errors due to small		
				keyboards. Thus, the means for obscuring authenticator feedback is selected accordingly.		
				Obscuring authenticator feedback includes displaying asterisks when users type passwords		
				into input devices, or displaying feedback for a very limited time before obscuring it.		
IA-7	1	Identification and Authentication Cryptographic	Implement mechanisms for authentication to a cryptographic module that meet the requirements of applicable	Authentication mechanisms may be required within a cryptographic module to	AC-3. IA-5. SA-4. SC-	
^{''''}	*	Module Authentication	laws, executive orders, directives, policies, regulations, standards, and guidelines for such authentication.	authenticate an operator accessing the module and to verify that the operator is authorized		
				to assume the requested role and perform services within that role.		

Control ID IA-8	1	Control Name [Identification and Authentication Identification and Authentication Identification and Authentication (non-organizational Users)	Withdrawn	Control Text Uniquely identify and authenticate non-organizational users or processes acting on behalf of non-organizational users.	Discussion Non-organizational users include system users other than organizational users explicitly covered by IA-2. Non-organizational users are uniquely identified and authenticated for accesses other than those accesses explicitly identified and documented in AC-14. Identification and authentication of non-organizational users accessing federal systems may be required to protect federal, proprietary, or privacy-related information (with exceptions noted for national security systems). Organizations consider many factors, including security, privacy, scalability, and practicality in balancing the need to ensure ease of use for access to federal information and systems with the need to protect and adequately mitigate risk.		Notes
IA-8 (1)	2	Identification and Authentication Identification and Authentication (non-organizational Users) Acceptance of PIV Credentials from Other Agencies		Accept and electronically verify Personal Identity Verification-compliant credentials from other federal agencies.	Acceptance of Personal identity Verification [PV] cedentials from other federal agencies applies to both logical and physical access control systems. PV credentials are those credentials issued by federal agencies that conform to FIRS Publication 201 and supporting guidelines. The adequacy and reliability of PIV card issuers are addressed and authorized using ISP 800-79-21.	PE-3	
IA-8 (2)	2	Identification and Authentication Identification and Authentication (non-organizational Users) Acceptance of External Credentials		Accept only external credentials that are NIST-compliant.	Acceptance of only NIST-compliant external credentials applies to arganizational systems that are accessible to the public (e.g., public/Gaine) websites!. External credentials are those credentials issued by nonfederal government entities. External credentials are certified as compliant with [5P 800-63-3] by an approved accreditation authority. Approved external credentials meet or exceed the set of minimum federal government-wide technical, security, privacy, and arganizational maturity requirements. Meeting or exceeding federal requirements allows federal government relying parties to trust external credentials at their approved assurance levels.		
IA-8 (3)	2	Identification and Authentication Identification and Authentication (non-organizational Users) Use of Ficam-approved Products	Х				[Withdrawn: Incorporated into IA-8 [2]]
IA-8 (4)	2	Identification and Authentication Identification and Authentication (non-organizational Users) Use of Nist-issued Profiles		Conform to NIST-issued profiles for identity management.	Conformance with NIST-issued profiles for identity management addresses open identity management standards. To ensure that open identity management standards are viable, robust, reliable, sustainable, and interoperable as documented, the United States Government assesses and scopes the standards and technology implementations against applicable laws, executive orders, directives, policies, regulations, standards, and guidelines. The result is NIST-issued implementation profiles of approved protocols.		
IA-8 (5)	2	Identification and Authentication Identification and Authentication (non-organizational Users) Acceptance of PIV-I Credentials		Accept and verify federated or PKI credentials that meet [Assignment: organization-defined policy].	This control enhancement can be implemented by PIV, PIVI, and other commercial or external identity providers. Acceptance and verification of Personal Identity Verification (PIV)-t-compliant credentials applies to both logical and physical access control systems. Acceptance and verification of PIVI-I credentials addresses nonfederal issuers of identity cards that desire to interoperate with United States Governmen IPV systems and that can be trusted by federal government-relying parties. The X-SO9 certificate policy for the Federal Bridge Certification Authority (FedA) addresses PIVI requirements. The PIVI-L ard is commensurate with the PIVI credentials as defined in cited references. PIVI-I credentials are the credentials issued by a PIV-I provider whose PIVI-L certificate policy maps to the Federal Bridge PIVI-I certificate Policy. A PIV-I provider is cross-certified with the FECA (directly or through another PIX bridge) with policies that have been mapped and approved as meeting the requirements of the PIVI-I policies defined in the FBCA certificate policy.		
IA-8 (6)	2	Identification and Authentication Identification and Authentication (non-organizational Users) Disassociability		Implement the following measures to disassociate user attributes or credential assertion relationships among individuals, credential service providers, and relying parties: [Assignment: organization-defined measures].	Federated identity solutions can create increased privacy risks due to tracking and profiling of individuals. Using identifier mapping tobles or cryptographic techniques to blind credential service providers and relying parties from each other or to make identity attributes less visible to transmitting parties can reduce these privacy risks.		
IA-9	1	Identification and Authentication Service Identification and Authentication		Uniquely identify and authenticate [Assignment: organization-defined system services and applications] before establishing communications with devices, users, or other services or applications.	Services that may require identification and authentication include web applications using digital certificates or services or applications that query a database. Identification and authentication methods for system services/applications include information or code signing, provenance graphs, and/or electronic signatures indicating the sources of services. Decisions regarding the validation of identification and authentication claims can be made by services separate from the services acting on those decisions. This can occur in distributed system architectures, in such situations, the identification and authentication decisions (instead of actual identifiers and authenticators) are provided to the services that need to act on those decisions.	IA-3, IA-4, IA-5, SC-8	
IA-9 (1)	2	Identification and Authentication Service Identification and Authentication Information	X				[Withdrawn: Incorporated into IA-9]
IA-9 (2)	2	Exchange Identification and Authentication Service Identification and Authentication Transmission of Decisions	Х				[Withdrawn: Incorporated into IA-9]
IA-10	1	Identification and Authentication Adaptive Authentication		Require individuals accessing the system to employ [Assignment: organization-defined supplemental authentication techniques or mechanisms] under specific [Assignment: organization-defined circumstances or situations].	Adversaries may compromise individual authentication mechanisms employed by organizations and subsequently attempt to impersonate legitimate users. To address this threat, organizations may employ specific techniques or mechanisms and establish protocols to assess suspicious behavior. Suspicious behavior may include accessing information that individuals do not typically access as part of their duties, roles, or responsibilities; accessing greater quantities of information than individuals would routinely access; or attempting to access information from suspicious network addresses. When pre- established conditions or triggers occur, organizations can require individuals to provide additional authentication information. Another potential use for adaptive authentication to increase the strength of mechanism based on the number or types of records being accessed. Adaptive authentication does not replace and is not used to avoid the use of multifactor authentication mechanisms but can augment implementations of these controls.	IA-2, IA-8	
IA-11	1	Identification and Authentication Re-authentication		Require users to re-authenticate when [Assignment: organization-defined circumstances or situations requiring re-authentication].	In addition to the re-authentication requirements associated with device locks, organizations may require re-authentication of individuals in certain situations, including when authenticators or roles fandage; when security categories of systems change; when the execution of privileged functions occurs; after a fixed time-period; or periodically.	AC-3, AC-11, IA-2, IA-3, IA-8

		incluent response reum	the organization in [Assignment: organization-defined time period].	responds to incidents so that organizational systems and networks can recover quickly and		
				can implement the necessary controls to avoid future incidents. Incident response team		
				personnel include forensic and malicious code analysts, tool developers, systems security		
				engineers, and real-time operations personnel. The incident handling capability includes		
				performing rapid forensic preservation of evidence and analysis of and response to		
				intrusions. For some organizations the incident response team can be a cross organizational		
				entity.		
				An integrated incident response team facilitates information sharing and allows		
				organizational personnel (e.g., developers, implementers, and operators), to leverage team		
				knowledge of the threat and to implement defensive measures that enable organizations to		
				deter intrusions more effectively. Moreover, integrated teams promote the rapid detection		
				of intrusions, development of appropriate mitigations, and the deployment of effective		
				defensive measures. For example, when an intrusion is detected, the integrated team can		
				rapidly develop an appropriate response for operators to implement, correlate the new		
				incident with information on past intrusions, and augment ongoing cyber intelligence		
				development. Integrated incident response teams are better able to identify adversary		
				tactics, techniques, and procedures that are linked to the operations tempo or to specific		
				missions and business functions, and to define responsive actions in a way that does not		
				disrupt those missions and business functions. Incident response teams can be distributed		
				within organizations to make the capability resilient.

	1			deception environment, the analysis of anomalous adversarial behavior (e.g., changes in		
				system performance or usage patterns) or suspected behavior (e.g., changes in searches for		
	1			the location of specific resources) can give the organization such insight.		
IR-4 (14)	2	Incident Response Incident Handling Security	Establish and maintain a security operations center.	A security operations center (SOC) is the focal point for security operations and computer		
		Operations Center		network defense for an organization. The purpose of the SOC is to defend and monitor an		
		l'		organization's systems and networks (i.e., cyber infrastructure) on an ongoing basis. The		
				SOC is also responsible for detecting, analyzing, and responding to cybersecurity incidents		
				in a timely manner. The organization staffs the SOC with skilled technical and operational		
				personnel (e.g., security analysts, incident response personnel, systems security engineers)		
				and implements a combination of technical, management, and operational controls		
				(including monitoring, scanning, and forensics tools) to monitor, fuse, correlate, analyze,		
				and respond to threat and security-relevant event data from multiple sources. These		
				sources include perimeter defenses, network devices (e.g., routers, switches), and endpoint		
				agent data feeds. The SOC provides a holistic situational awareness capability to help		
				organizations determine the security posture of the system and organization. A SOC		
				capability can be obtained in a variety of ways. Larger organizations may implement a		
				dedicated SOC while smaller organizations may employ third-party organizations to provide		
				such capability.		
IR-4 (15)	2	Incident Response Incident Handling Publication	(a) Manage public relations associated with an incident; and	It is important for an organization to have a strategy in place for addressing incidents that		
		Relations and Reputation Repair	(b) Employ measures to repair the reputation of the organization.	have been brought to the attention of the general public and that have cast the		
				organization in a negative light or affected the organization's constituents (e.g., partners,		
				customers). Such publicity can be extremely harmful to the organization and effect its		
				ability to effectively carry out its missions and business functions. Taking proactive steps to		
				repair the organization's reputation is an essential aspect of reestablishing trust and		
				confidence of its constituents.		
IR-5	1	Incident Response Incident Monitoring	Track and document security, privacy, and supply chain incidents.	Documenting incidents includes maintaining records about each incident, the status of the

Control ID	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls Notes
MA-4 (6)	2	Maintenance Nonlocal Maintenance	Implement the following cryptographic mechanisms to protect the integrity and confidentiality of nonlocal	Failure to protect nonlocal maintenance and diagnostic communications can result in	SC-8, SC-13
		Cryptographic Protection	maintenance and diagnostic communications: [Assignment: organization-defined cryptographic mechanisms].	unauthorized individuols gaining access to sensitive organizational information. Unauthorized access during remote maintenance sessions can result in a variety of hostile actions including malicious code insertion, unauthorized changes to system parameters, and explitation of organizational information. Such actions can result in the loss or degradation of mission capability.	
MA-4 (7)		Maintenance Nonlocal Maintenance Disconnect Verification	Verify session and network connection termination after the completion of nonlocal maintenance and diagnostic sessions.	This control enhancement ensures that connections established during nonlocal maintenance and diagnostic sessions have been terminated and are no longer available for use.	AC-12
MA-5		Maintenance Maintenance Personnel	a. Establish a process for maintenance personnel authorization and maintain a list of authorized maintenance organizations or personnel; b. Verify that non-escorted personnel performing maintenance on the system possess the required access authorizations; and c. Designate organizational personnel with required access authorizations and technical competence to supervise the maintenance activities of personnel who do not possess the required access authorizations.	systems. Technical competence of supervising individuals relates to the maintenance performed on the systems while having required access authorizations refers to maintenance on and near the systems. Individuals not previously identified as authorized maintenance personnel, such as information technology manufacturers, vendors, systems integrators, and consultants, may require privileged access to organizational systems, for example, when required to conduct maintenance activities with little or no notice. Based on organizational assessments of risk, organizations may issue temporary credentials to these individuals. Temporary credentials may be for one-time use or for very limited time-periods.	MP-2, PE-3, PS-7, RA-3
MA-5 (1)		Maintenance Maintenance Personnel Individuals Without Appropriate Access	(a) Implement procedures for the use of maintenance personnel that lack appropriate security clearances or are not U.S. citizens, that include the following requirements: (1) Maintenance personnel who do not have needed access authorizations, clearances, or formal access approvals are escorted and supervised during the performance of maintenance and diagnostic activities on the system by approved organizational personnel who are refully cleared, have appropriate access authorizations, and are technically qualified; (2) Prior to initiating maintenance or diagnostic activities by personnel who do not have needed access authorizations, clearances or formal access approvals, all volatile information storage components within the system are sanitized and all nonvolatile storage media are removed or physically disconnected from the system and secured; and (b) Develop and implement [Assignment: organization-defined alternate controls] in the event a system component cannot be sanitized, removed, or disconnected from the system.	citizens are intended to deny visual and electronic access to classified or controlled unclassified information contained an arganizational systems. Procedures for the use of maintenance personnel can be documented in security plans for the systems.	MP-6, PL-2
MA-5 (2)	2	Maintenance Maintenance Personnel Security Clearances for Classified Systems	Verify that personnel performing maintenance and diagnostic activities on a system processing, storing, or transmitting classified information possess security clearances and formal access approvals for at least the highest classification level and for compartments of information on the system.	Personnel conducting maintenance on arganizational systems may be exposed to classified information during the course of their maintenance activities. To mitigate the inherent risk of such exposure, organizations use maintenance personnel that are cleared (i.e., possess security clearances) to the classification level of the information stored on the system.	PS-3
MA-5 (3)	2	Maintenance Maintenance Personnel Citizenship Requirements for Classified Systems	Verify that personnel performing maintenance and diagnostic activities on a system processing, storing, or transmitting classified information are U.S. citizens.	Personnel conducting maintenance on arganizational systems may be exposed to classified information during the course of their maintenance activities. If access to classified information on arganizational systems is restricted to U.S. citizens, the same restriction is applied to personnel performing maintenance on those systems.	PS-3
MA-5 (4)	2	Maintenance Maintenance Personnel Foreign Nationals	Verify that: (a) Foreign nationals with appropriate security clearances are used to conduct maintenance and diagnostic activities on classified systems only when the systems are jointly owned and operated by the United States and foreign allied governments, or owned and aperated solely by foreign allied governments; and (b) Approvals, consents, and detailed operational conditions regarding the use of foreign nationals to conduct maintenance and diagnostic activities on classified systems are fully documented within Memoranda of Agreements.	Personnel conducting maintenance on arganizational systems may be exposed to classified information during the course of their maintenance activities. To mitigate the inherent risk of such exposure, organizations use maintenance personnel that are cleared (i.e., possess security clearances) to the classification level of the information stored on the system.	PS-3
MA-5 (5)		Maintenance Maintenance Personnel Non-system Maintenance	Verify that non-escorted personnel performing maintenance activities not directly associated with the system but in the physical proximity of the system, have required access authorizations.	Personnel performing maintenance activities in other capacities not directly related to the system include physical plant personnel and custodial personnel.	
MA-6		Maintenance Timely Maintenance	Obtain maintenance support and/or spare parts for [Assignment: organization-defined system components] within [Assignment: organization-defined time-period] of failure.	Organizations specify the system components that result in increased risk to organizational operations and assets, individuals, other organizations, or the Nation when the functionality provided by those components is not operational. Organizational actions to obtain maintenance support include having appropriate contracts in place.	CM-8, CP-2, CP-7, RA- 7, SA-15, S1-13, SR-2, SR-3, SR-4
MA-6 (1)		Maintenance Timely Maintenance Preventive Maintenance	Perform preventive maintenance on [Assignment: organization-defined system components] at [Assignment: organization-defined time intervals].	Preventive maintenance includes practive care and the servicing of system components to maintain organizational equipment and facilities in satisfactory operating condition. Such maintenance provides for the systematic inspection, tests, measurements, adjustments, parts replacement, detection, and correction of incipient failures either before they occur before they develop into major defects. The primary good of preventive maintenance is a void or mitigate the consequences of equipment failures. Preventive maintenance is designed to preserve and restore equipment reliability by replacing worn components before they fail. Methods of determining what preventive (or other) failure management policies to apply include original equipment manufacturer recommendations; statistical failure records; expert apinion; maintenance that has already been conducted on similar equipment; requirements of codes, laws, or regulations within a jurisdiction; or measured values and performance indications.	
MA-6 (2)		Maintenance Timely Maintenance Predictive Maintenance	Perform predictive maintenance on [Assignment: organization-defined system components] at [Assignment: organization-defined time intervals].	Predictive maintenance evaluates the condition of equipment by performing periodic or continuous (online) equipment condition monitoring. The goal of predictive maintenance is to perform maintenance at scheduled time when the maintenance activity is most cost-effective and before the equipment loses performance within a threshold. The predictive component of predictive maintenance stems from the objective of predicting the future trend of the equipment's condition. The predictive maintenance approach employs principles of statistical process control to determine at what point in the future maintenance activities will be appropriate. Most predictive maintenance inspections are performed while equipment is in service, thus, minimizing disruption of normal system operations. Predictive maintenance can result in substantial cost savings and higher system reliability.	
MA-6 (3)	2	Maintenance Timely Maintenance Automated Support for Predictive Maintenance	Transfer predictive maintenance data to a maintenance management system using [Assignment: organization- defined automated mechanisms].	A computerized maintenance management system maintains a database of information about the maintenance operations of organizations and automates processing equipment condition data to trigger maintenance planning, execution, and reporting.	

MA-7	1	Control Name Maintenance Field Maintenance	withdrawn	Control Text Restrict or prohibit field maintenance on [Assignment: organization-defined systems or system components] to [Assignment: organization-defined trusted maintenance facilities].	Discussion: Field maintenance is the type of maintenance conducted on a system or system component after the system or component has been deployed to a specific site (i.e., operational environment). In certain instances, field maintenance (i.e., local maintenance at the site) may not be executed with the same degree of rigor or with the same quality control checks as depot maintenance. For critical systems designated as such by the organization, it may be necessary to restrict or prohibit field maintenance at the local site and require that such maintenance be conducted in trusted facilities with additional controls.		Notes
MP-1		Media Protection Policy and Procedures		a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more): organization-level; mission/business process-level; system-level] media protection policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and (b) is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the media protection policy and the associated media protection controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the media protection; 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the MP family implemented within systems and organizations. The risk management strategy is an important factor in testablishing such policies and procedures. Policies and procedures belief provide security and privacy assurance. Therefore, it is important that security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy policy or as emplemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in system scurity and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.	PM-9, PS-8, SI-12	
MP-2	1	Media Protection Media Access		Restrict access to [Assignment: organization-defined types of digital and/or non-digital media] to [Assignment: organization-defined personnel or roles].	diskettes, magnetic tapes, external or removable hard disk drives (solid state, magnetic), compact disks, and digital video disks. Non-digital media includes paper and microfilm.	AC-19, AU-9, CP-2, CP 9, CP-10, MA-5, MP- 4, MP-6, PE-2, PE-3, SC-13, SC-34, SI-12	
MP-2 (1)	2	Media Protection Media Access Automated Restricted Access	X				[Withdrawn: Incorporated into MP-4 (2)]
MP-2 (2)	2	Media Protection Media Access Cryptographic Protection	X				[Withdrawn: Incorporated into SC-28 [1]]
MP-3	1	Media Protection Media Marking		a. Mark system media indicating the distribution limitations, handling caveats, and applicable security markings (if any) of the information; and b. Exempt [Assignment: organization-defined types of system media] from marking if the media remain within [Assignment: organization-defined controlled areas].		AC-16, CP-9, MP-5, PE-22, SI-12	
MP-4	1	Media Protection Media Storage		a. Physically control and securely store [Assignment: organization-defined types of digital and/or non-digital media] within [Assignment: organization-defined controlled areas); and b. Protect system media types defined in MP-4a until the media are destroyed or sanitized using approved equipment, techniques, and procedures.	diskettes, magnetic tapes, external or removable hard disk drives (solid state, magnetic), compact disks, and digital video disks. Non-digital media includes paper and microfilm.	AC-19, CP-2, CP-6, CP 9, CP-10, MP-2, MP- 7, PF-3, PI-2, SC-13, SC-28, SC-34, SI-12	
MP-4 (1)	2	Media Protection Media Storage Cryptographic	X				[Withdrawn: Incorporated into SC-28 (1)]
MP-4 (2)	2	Media Protection Media Storage Automated Restricted Access		Restrict access to media storage areas, log access attempts, and access granted using [Assignment: organization-defined automated mechanisms].	Automated mechanisms include keypads or card readers on the external entries to media storage areas.	AC-3, AU-2, AU-6, AU- 9, AU-12, PE-3	
MP-S	1	Media Protection Media Transport		a. Protect and control [Assignment: organization-defined types of system media] during transport outside of controlled areas using [Assignment: organization-defined controls]; b. Maintain accountability for system media during transport outside of controlled areas; c. Document activities associated with the transport of system media; and d. Restrict the activities associated with the transport of system media to authorized personnel.	System media includes digital and non-digital media. Digital media includes flash drives, diskettes, magnetic tapes, external or removable hard disk drives (solid state and magnetic), compact disks, and digital video disks. Non-digital media includes microfilm and	AC-7, AC-19, CP-2, CP 9, MP-3, MP-4, PE- 16, PI-2, SC-13, SC- 28, SC-34	

Control ID	Level	Control Name	Withdrawn	Control Text	Discussion	Related Controls	Notes
MP-5 (1)	2	Media Protection Media Transport Protection Outside of Controlled Areas	X	Conto Lex	O Secusion Secusion	Related Controls	[Withdrawn: Incorporated into MP-5]
MP-5 (2)	2	Media Protection Media Transport Documentation of Activities	X				[Withdrawn: Incorporated into MP-5]
MP-5 (3)	2	Media Protection Media Transport Custodians		Employ an identified custodion during transport of system media outside of controlled areas.	Identified custodians provide organizations with specific points of contact during the media transport process and facilitate individual accountability. Custodial responsibilities can be transferred from one individual to another if an unambiguous custodian is identified.		
MP-5 (4)	2	Media Protection Media Transport Cryptographic	X				[Withdrawn: Incorporated into SC-28 (1)]
MP-6		Media Protection Media Sanitization		a. Sanitize [Assignment: organization-defined system media] prior to disposal, release out of organizational control, or release for reuse using [Assignment: organization-defined sanitization techniques and procedures]; and b. Employ sanitization mechanisms with the strength and integrity commensurate with the security category or classification of the information.	mobile devices, and non-digital media such as paper and microfilm. The santization process removes information from system media such that the information cannot be retrieved or reconstructed. Santization techniques, including clearing, purging, cryptographic erase, deidentification of personally identifiable information, and destruction, prevent the disclosure of information to unauthorized individuals when such media is reused or released for disposal. Organizations determine the appropriate santization methods recognizing that destruction is sometimes necessary when other methods cannot be applied to media requiring santization. Organizations use discretion on the employment of approved santization techniques and procedures for media containing information deemed to be in the public domain or publicly releasable or information deemed to have no adverse impact on organizations or individuals if released for reuse or disposal. Santitization of non-digital media includes destruction, removing a classified appendix from an otherwise unclassified document, or redacting selected sections or words from a document by obscuring the readacted sections or words fina a manner equivalent in effectiveness to removing them from the document. NARA policies controls the santitization process for controlled unclassified information. NSA standards and policies control the santitization process for media containing classified information.	MA-2, MA-3, MA-4, MA-5, PM-22, SI-12,	
MP-6 (1)	2	Media Protection Media Sanitization Review, Approve, Track, Document, and Verify		Review, approve, track, document, and verify media sanitization and disposal actions.	Organizations review and approve media to be sanitized to ensure compliance with records- retention policies. Tracking and documenting actions include listing personnel who reviewed and approved sanitization and disposal actions; types of media sonitized; files stored on the media; sanitization methods used; date and time of the sanitization actions; personnel who performed the sanitization; verification actions taken and personnel who performed the verification; and the disposal actions taken. Organizations verify that the sanitization of the media was effective prior to disposal.		
MP-6 (2)	2	Media Protection Media Sanitization Equipment Testing		Test sanitization equipment and procedures [Assignment: organization-defined frequency] to verify that the intended sanitization is being achieved.	Testing of sanitization equipment and procedures may be conducted by qualified and authorized external entities, including federal agencies or external service providers.		
MP-6 (3)	2	Media Protection Media Sanitization Nondestructive Techniques		Apply nandestructive sanitization techniques to portable storage devices prior to connecting such devices to the system under the following circumstances: [Assignment: organization-defined circumstances requiring sanitization of portable storage devices].	nortable storage devices include external or removable hard disk drives (solid state, magnetic), optical discs, magnetic or optical tapes, flash memory devices, flash memory cards, and other external or removable disks. Prortable storage devices can be obtained from untrustworthy sources and can contain malicious code that can be inserted into or transferred to arganizational systems through USB ports or other entry portals. While scanning storage devices is recommended, sanitization provides additional assurance that such devices are free of malicious code. Organizations consider nondestructive sanitization of portable storage devices when the devices are purchased from manufacturers or vendors prior to initial use or when organizations cannot maintain a positive chain of custady for the devices.		
MP-6 (4)	2	Media Protection Media Sanitization Controlled	X				[Withdrawn: Incorporated into MP-6]
MP-6 (5)	2	Unclassified Information Media Protection Media Sanitization Classified	X				[Withdrawn: Incorporated into MP-6]
MP-6 (6)	2	Media Protection Media Sanitization Media Destruction	X				[Withdrawn: Incorporated into MP-6]
MP-6 (7)	2	Media Protection Media Sanitization Dual Authorization		Enforce dual authorization for the sanitization of [Assignment: organization-defined system medio].	Organizations employ dual authorization to help ensure that system media sanitization cannot occur unless two technically qualified individuals conduct the designated task. Individuals sanitizing system media possess sufficient silkil and expertise to determine if the proposed sanitization reflects applicable federal and arganizational standards, policies, and procedures. Dual outhorization also helps to ensure that sanitization occurs as intended, both protecting against errors and false claims of having performed the sanitization actions. Dual authorization may also be known as two person control. To reduce the risk of collusion, organizations consider rotating dual authorization duties to other individuals.	AC-3, MP-2	
MP-6 (8)	2	Media Protection Media Sanitization Remote Purging or Wiping of Information		Provide the capability to purge or wipe information from [Assignment: organization-defined systems or system components] [Selection: remotely; under the following conditions: [Assignment: organization-defined conditions]].	Remote purging or wiping of information protects information on organizational systems and system components if systems or components are obtained by unauthorized individuals. Remote purge or wipe commands require strong authentication to help mitigate the risk of unauthorized individuals purging or wiping the system, component, or device. The purge or wipe function can be implemented in a variety of ways, including by overwriting data or information multiple times or by destroying the key necessary to decrypt encrypted data.		

Control ID Le		Control Name Withdrawn	Control Text		Related Controls	
MP-7		Media Protection Media Use	a. [Selection: Restrict; Prohibit] the use of [Assignment: organization-defined types of system media] on [Assignment: organization-defined systems or system components] using [Assignment: organization-defined controls]; and b. Prohibit the use of portable storage devices in organizational systems when such devices have no identifiable owner.	System media includes both digital and non-digital media. Digital media includes diskettes, magnetic tapes, flash drives, compact disk, digital wideo disks, and removable hard disk drives. Non-digital media includes paper and microfilm. Media use protections also apply to mobile devices with information storage capability. In contrast to MP-2, which restricts user access to media, MP-7 restricts bus es of certain hypes of media on systems, for example, restricting or prohibiting use of flash drives or external hard disk drives. Organizations use technical and nontechnical controls to restrict the use of system media. Organizations use vestrict the use of portable storage devices, for example, by using physical cages on workstations to prohibit access to certain external ports, or disabling or removing the ability to insert, read or write to such devices. Organizations may also limit the use of portable storage devices to only approved devices. Organizations mind the use of portable storage devices to only approved devices, including devices provided by the rapproved organizations, and devices that are not personally owned. Finally, organizations may restrict the use of portable storage devices based on the type of device, for example, prohibiting the use of writeable, portable storage devices, and implementing this restriction by disabling or removing the capability to write to such devices. Requiring identifiable owners for storage devices reduces the risk of using such devices by allowing organizations to assign responsibility for addressing known vulnerabilities in the devices.	AC-19, AC-20, PL-4, PM-12, SC-34, SC-41	
MP-7 (1)	2	Media Protection Media Use Prohibit Use Without X				[Withdrawn: Incorporated into MP-7]
MP-7 (2)	2	Owner Media Protection Media Use Prohibit Use of Sonitization-resistant Media	Prohibit the use of sanitization-resistant media in organizational systems.	Sanitization-resistance refers to non-destructive sanitization techniques and applies to the capability to purge information from media. Certain types of media do not support sanitization commands, or if supported, the interfaces are not supported in a standardized way across these devices. Sanitization-resistant media include compact flash, embedded flash on boards and devices, solid state drives, and USB removable media.	MP-6	
MP-8		Media Protection Media Downgrading	a. Establish [Assignment: organization-defined system media downgrading process] that includes employing downgrading mechanisms with strength and integrity commensurate with the security category or dassification of the information stops; b. Verify that the system media downgrading process is commensurate with the security category and/or classification level of the information to be removed and the access authorizations of the potential recipients of the downgraded information; c. Identify [Assignment or cganization-defined system media requiring downgrading); and d. Downgrade the identified system media using the established process.	downgrading process, when applied to system media, removes information from the media, typically by security category or classification level, such that the information cannot		
MP-8 (1)	2	Media Protection Media Downgrading Documentation of Process	Document system media downgrading actions.	Organizations can document the media downgrading process by providing information such as the downgrading technique employed, the identification number of the downgraded media, and the identity of the individual that authorized and/or performed the downgrading action.		
MP-8 (2)	2	Media Protection Media Downgrading Equipment Testing	Test downgrading equipment and procedures [Assignment: organization-defined frequency] to verify that	None.		
MP-8 (3)	2	resumy Media Protection Media Downgrading Controlled Unclassified Information	downgrading actions are being achieved. Downgrade system media containing controlled unclassified information prior to public release.	Downgrading of controlled unclassified information uses approved sanitization tools, techniques, and procedures.		
MP-8 (4)		Media Protection Media Downgrading Classified Information	Downgrade system medio containing classified information prior to release to individuals without required access authorizations.	Techniques, unit procedures. Downgrading of classified information uses approved sanitization tools, techniques, and procedures to transfer information confirmed to be unclassified from classified systems to unclassified media.		
PE-1		Physical and Environmental Protection Policy and Procedures	a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more]: organization-level; mission/business process-level; system-level] physical and environmental protection policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compilance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the physical and environmental protection policy and the associated physical and environmental protection controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the physical and environmental protection policy and procedures; and c. Review and update the current physical and environmental protection: 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the PE family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy policy or can be represented by multiple policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.	12	
PE-2	1	Physical and Environmental Protection Physical Access Authorizations	Develop, approve, and maintain a list of individuals with authorized access to the facility where the system resides; b. Issue authorization credentials for facility access; c. Review the access list detailing authorized facility access by individuals [Assignment: organization-defined frequency]; and d. Remove individuals from the facility access list when access is no longer required.	Physical access authorizations apply to employees and visitors. Individuals with permanent physical access authorization credentials are not considered visitors. Authorization credentials include biometrics, badges, identification cards, and smart cards. Organizations determine the strength of authorization credentials needed consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines. Physical access authorizations are not necessary to access areas within facilities that are designated as publicly accessible.	5, MP-2, PE-3, PE-4, PE-5, PE-8, PM-12, PS	
PE-2 (1)	2	Physical and Environmental Protection Physical Access Authorizations Access by Position or Role	Authorize physical access to the facility where the system resides based on position or role.	Role-based facility access includes permanent maintenance personnel, duty officers, or emergency medical staff.	AC-2, AC-3, AC-6	
PE-2 (2)	2	Physical and Environmental Protection Physical Access Authorizations Two Forms of Identification	Require two forms of identification from the following forms of identification for visitor access to the facility where the system resides: [Assignment: organization-defined list of acceptable forms of identification].	Acceptable forms of identification include passports, REAL ID-compliant drivers' licenses, and Personal Identity Verification (PIV) cards. For gaining access to facilities using automated mechanisms, organizations may use PIV cards, key cards, PINs, and biometrics.	IA-2, IA-4, IA-5	
PE-2 (3)	2	Physical and Environmental Protection Physical Access Authorizations Restrict Unescorted Access	Restrict unescorted access to the facility where the system resides to personnel with [Selection (one or more): security (bearances for all information contained within the system; formal access authorizations for all information contained within the system; need for access to all information contained within the system; [Assignment: organization-defined credentials]].	Individuals without required security clearances, access approvals, or need to know, are escorted by individuals with appropriate credentials to ensure that information is not exposed or otherwise compromised. Alorm systems work in conjunction with physical barriers, physical access control systems, and security quards, triggering a response when these other forms of security have been compromised or breached. Physical intrusion alarms can include different types of sensor devices, for example, motion sensors, contact sensors, and broken glass sensors. Surveillance equipment includes video cameras installed at strategic locations throughout the facility.		
PE-6 (2)		Physical and Environmental Protection Monitoring Physical Access Automated Intrusion Recognition and Responses	Recognize [Assignment: organization-defined classes or types of intrusions] and initiate [Assignment: organization-defined response actions] using [Assignment: organization-defined automated mechanism	include system alert notifications, email and text messages, and activating door locking mechanisms. Physical access monitoring can be coordinated with intrusion detection systems and system monitoring capabilities to provide integrated threat coverage for the organization.	SI-4	
PE-6 (3)		Physical and Environmental Protection Monitoring Physical Access Video Surveillance	(a) Employ video surveillance of [Assignment: organization-defined operational areas]; (b) Review video recordings [Assignment: organization-defined frequency]; and (c) Retain video recordings for [Assignment: organization-defined time-period].	Video surveillance focuses on recording activity in specified areas for purposes of subsequent review, if circumstances so warrant. Video recordings are typically reviewed to detect anomalous events or incidents. Monitoring the surveillance video is not required although organizations may choose to do so. There may be legal considerations when performing and retaining video surveillance, especially if such surveillance is in a public location.		
PE-6 (4)	2	Physical and Environmental Protection Monitoring Physical Access Monitoring Physical Access to Systems	Monitor physical access to the system in addition to the physical access monitoring of the facility at [Assignment: organization-defined physical spaces containing one or more components of the system].	Monitoring physical access to systems provides additional monitoring for those areas within facilities where there is a concentration of system components, including server rooms, media storage areas, and communications centers. Physical access monitoring can be coordinated with intrusion detection systems and system monitoring capabilities to provide comprehensive and integrated threat coverage for the organization.		
PE-7	1	Physical and Environmental Protection Visitor Control				[Withdrawn: Incorporated into PE-2, PE-3]
PE-8		Physical and Environmental Protection Visitor Access Records	a. Maintain visitor access records to the facility where the system resides for [Assignment: organization-time-period], b. Review visitor access records [Assignment: organization-defined frequency]; and c. Report anomalies in visitor access records to [Assignment: organization-defined personnel].	signatures; forms of identification; dates of access; entry and departure times; purpose of visits; and names and organizations of persons visited. Reviews of access records determines if access authorizations are current and still required to support organizational missions and business functions. Access records are not required for publicly accessible areas.	PE-2, PE-3, PE-6	
PE-8 (1)	2	Physical and Environmental Protection Visitor Access Records Automated Records Maintenance and Review	Mointain and review visitor access records using [Assignment: organization-defined automated mechan	isms]. Visitor access records can be stored and maintained, for example, in a database management system that is accessible by organizational personnel. Automated access to such records facilitates record reviews on regular basis to determine if access authorizations are current and still required to support organizational missions and business functions.		
PE-8 (2)	2	Physical and Environmental Protection Visitor Access Records Physical Access Records				[Withdrawn: Incorporated into PE-2]
PE-9		Physical and Environmental Protection Power Equipment and Cabling	Protect power equipment and power cabling for the system from damage and destruction.	Organizations determine the types of protection necessary for the power equipment and cabling employed at different locations both internal and external to organizational facilities and environments of operation. Power equipment and cabling includes generators and power cabling outside of buildings; internal cabling and uninterruptable power sources in offices or data centers; and power sources for self-contained components such as satellites, whicles, and other deployable systems.	PE-4	
PE-9 (1)	2	Physical and Environmental Protection Power Equipment and Cabling Redundant Cabling	Employ redundant power cabling paths that are physically separated by [Assignment: organization-defi- distance].	Physically separate and redundant power cables ensure that power continues to flow in the event one of the cables is cut or otherwise damaged.		
PE-9 (2)		Physical and Environmental Protection Power Equipment and Cabling Automatic Voltage Controls	Employ automatic voltage controls for [Assignment: organization-defined critical system components].	Automatic voltage controls can monitor and control voltage. Such controls include voltage regulators, voltage conditioners, and voltage stabilizers.		
PE-10	1	Physical and Environmental Protection Emergency Shutoff	a. Provide the capability of shutting off power to [Assignment: organization-defined system or individua components] in emergency situations; b. Place emergency shutoff switches or devices in [Assignment: organization-defined location by system system component] to facilitate access for authorized personnel; and c. Protect emergency power shutoff capability from unauthorized activation.	concentrations of system resources, including data centers, mainframe computer rooms,	PE-15	
PE-10 (1)	2	Physical and Environmental Protection Emergency Shutoff Accidental and Unauthorized Activation				[Withdrawn: Incorporated into PE-10]
PE-11	1	Physical and Environmental Protection Emergency Power	Provide an uninterruptible power supply to facilitate [Selection (one or more): an orderly shutdown of t system; transition of the system to long-term alternate power] in the event of a primary power source I		AT-3, CP-2, CP-7	
PE-11 (1)	2	Physical and Environmental Protection Emergency Power Alternate Power Supply — Minimal Operational Capability	Provide an alternate power supply for the system that is activated [Selection: manually; automatically] of can maintain minimally required operational capability in the event of an extended loss of the primary p source.			
PE-11 (2)	2	Physical and Environmental Protection Emergency Power Alternate Power Supply — Self-contained	Provide an alternate power supply for the system that is activated [Selection: manually; automatically] of its: (a) Self-contained; (b) Not reliant on external power generation; and (c) Capable of maintaining [Selection: minimally required operational capability; full operational capability the event of an extended loss of the primary power source.	and that The provision of a long-term, self-contained power supply, can be satisfied by using one or more generators with sufficient capacity to meet the needs of the organization.		
PE-12	1	Physical and Environmental Protection Emergency Lighting	Employ and maintain automatic emergency lighting for the system that activates in the event of a powe or disruption and that covers emergency exits and evacuation routes within the facility.	r outage The provision of emergency lighting applies primarily to organizational facilities containing concentrations of system resources, including data centers, server rooms, and mainframe computer rooms. Emergency lighting rovisions for the system are described in the contingency plan for the organization. If emergency lighting for the system cannot be provided or falls, organizations consider alternate processing sites.	CP-2, CP-7	
PE-12 (1)	2	Physical and Environmental Protection Emergency Lighting Essential Missions and Business Functions	Provide emergency lighting for all areas within the facility supporting essential missions and business ful	nctions. Organizations define their essential missions and functions.		

Control ID	Level		Withdrawn	Control Text	Discussion	Related Controls	Notes
PE-13	1	Physical and Environmental Protection Fire Protection		Employ and maintain fire detection and suppression systems that are supported by an independent energy source.	The provision of fire detection and suppression systems applies to organizational facilities containing concentrations of system resources, including data centers, server rooms. Fire detection and suppression systems that may require an independent energy source include sprinkler systems, fixed fire hoses, and smoke	AT-3	
PE-13 (1)	2	Observed and Services are also Department of Services		Front Condition to the state of	detectors.		
PE-13 (1)	2	Physical and Environmental Protection Fire Protection Detection Systems – Automatic Activation and Notification		Employ fire detection systems that activate outomatically and notify [Assignment: organization-defined personnel or roles] and [Assignment: organization-defined emergency responders] in the event of a fire.	Organizations can identify personnel, roles, and emergency responders fit individuals on the notification list need to have access authorizations or clearances, for example, to enter to facilities where access is restricted due to the classification or impact level of information within the facility. Notification mechanisms may require independent energy sources to ensure the notification capability is not adversely affected by the fire.		
PE-13 (2)	2	Physical and Environmental Protection Fire Protection Suppression Systems – Automatic Activation and Notification		(a) Employ fire suppression systems that activate automatically and notify [Assignment: organization-defined personnel or roles] and [Assignment: organization-defined emergency responders]; and (b) Employ an automatic fire suppression capability when the facility is not staffed on a continuous basis.	Organizations can identify specific personnel, roles, and emergency responders if individuals on the notification list need to have appropriate access authorizations and/or clearances, for example, to enter to facilities where access is restricted due to the impact level or classification of information within the facility. Notification mechanisms may require independent energy sources to ensure the notification capability is not adversely affected by the fire.		
PE-13 (3)	2	Physical and Environmental Protection Fire Protection Automatic Fire Suppression	X				[Withdrawn: Incorporated into PE-13 (2)]
PE-13 (4)	2	Physical and Environmental Protection Fire Protection Inspections		Ensure that the facility undergoes [Assignment: organization-defined frequency] fire protection inspections by authorized and qualified inspectors and identified deficiencies are resolved within [Assignment: organization-defined time-period].	Authorized and qualified personnel within the jurisdiction of the organization include state, county, and city fire inspectors and fire marshals. Organizations provide excorts during inspections in situations where the systems that reside within the facilities contain sensitive linformation.		
PE-14	1	Physical and Environmental Protection Environmental Controls		A Maintain [Selection (one or more): temperature; humidity, pressure; radiation; [Assignment: organization-defined environmental control]] levels within the facility where the system resides at [Assignment: organization-defined acceptable levels]; and b. Monitor environmental control levels [Assignment: organization-defined frequency].	The provision of environmental controls applies primarily to organizational facilities containing concentrations of system resources, for example, data centers, server rooms, and mainframe computer rooms. Insufficient controls, especially in harsh environments, can have a significant adverse impact on the systems and system components that are needed to support organizational missions and business functions. Environmental controls, such as electromagnetic pulse (EMP) protection described in PE-21, are especially significant for systems and applications that are part of the U.S. critical infrastructure.	AT-3, CP-2, PE-21	
PE-14 (1)	2	Physical and Environmental Protection Environmental Controls Automatic Controls		Employ the following automatic environmental controls in the facility to prevent fluctuations potentially harmful to the system: [Assignment: organization-defined automatic environmental controls].	The implementation of automatic environmental controls provides an immediate response to environmental conditions that can damage, degrade, or destroy organizational systems or systems components.		
PE-14 (2)	2	Physical and Environmental Protection Environmental Controls Monitoring with Alarms and Notifications		Employ environmental control monitoring that provides an alarm or notification of changes potentially harmful to personnel or equipment to [Assignment: organization-defined personnel or roles].	The alarm or notification may be, for example, an audible alarm or a message in real time to personnel or roles defined by the organization. Such alarms and/or notifications can help to minimize harm to individuals and damage to organizational assets by facilitating a timely incident response.		
PE-15	1	Physical and Environmental Protection Water Damage Protection		Protect the system from damage resulting from water leakage by providing master shutoff or isolation valves that are accessible, working properly, and known to key personnel.	The provision of water damage protection applies primarily to organizational facilities containing concentrations of system resources, including data centers, server rooms, and mainframe computer rooms. Solation valves can be employed in addition to or in lieu of master shutoff valves to shut off water supplies in specific areas of concern, without affecting entire organizations.	AT-3, PE-10	
PE-15 (1)	2	Physical and Environmental Protection Water Damage Protection Automation Support		Detect the presence of water near the system and alert [Assignment: organization-defined personnel or roles] using [Assignment: organization-defined automated mechanisms].	Automated mechanisms include notification systems, water detection sensors, and alarms.		
PE-16	1	Physical and Environmental Protection Delivery and Removal		a. Authorize and control [Assignment: organization-defined types of system components] entering and exiting the facility; and b. Maintain records of the system components.	Enforcing authorizations for entry and exit of system components may require restricting access to delivery areas and isolating the areas from the system and media libraries.	CM-3, CM-8, MA-2, MA-3, MP-5, PE-20, SR-2, SR-3, SR-4, SR-6	
PE-17	1	Physical and Environmental Protection Alternate Work Site		a. Determine and document the [Assignment: organization-defined alternate work sites] allowed for use by employees; b. Employ the following controls at alternate work sites: [Assignment: organization-defined controls]; c. Assess the effectiveness of controls at alternate work sites; and d. Provide a means for employees to communicate with information security and privacy personnel in case of incidents.	Alternate work sites include government facilities or the private residences of employees. While distinct from alternative processing sites, alternate work sites can provide readily available alternate locations during contingency operations. Organizations can define different sets of controls for specific alternate work sites or types of sites depending on the work-related activities conducted at those sites. This control supports the contingency planning activities of organizations.	AC-17, AC-18, CP-7	
PE-18	1	Physical and Environmental Protection Location of System Components		Position system components within the facility to minimize potential damage from [Assignment: organization-defined physical and environmental hazards] and to minimize the opportunity for unauthorized access.	Physical and environmental hazards include floods, fires, tornados, earthquakes, hurricanes, terrorism, vandalism, electromagnetic pulse, electrical interference, and other forms of incoming electromagnetic radiation. Organizations consider the location of entry opints where unauthorized individuals, while not being granted access, might nonetheless be near systems. Such proximity can increase the risk of unauthorized access to organizational communications, including using wireless sniffers or microphones.	CP-2, PE-19, PE- 20, RA-3	
PE-18 (1)	2	Physical and Environmental Protection Location of System Components Facility Site	X				[Withdrawn: Moved to PE-23]
PE-19	1	Physical and Environmental Protection Information Leakage		Protect the system from information leakage due to electromagnetic signals emanations.	Information leakage is the intentional or unintentional release of data or information to an untrusted environment from electromagnetic signals emanations. The security categories or classifications of systems (with respect to confidentiality), organizational security policies, and risk tolerance guide the selection of controls employed to protect systems against information leakage due to electromagnetic signals emanations.	AC-18, PE-18, PE-20	
PE-19 (1)	2	Physical and Environmental Protection Information Leakage National Emissions and Tempest Policies and Procedures		Protect system components, associated data communications, and networks in accordance with national Emissions Security policies and procedures based on the security category or classification of the information.	Emissions Security (EMSEC) policies include the former TEMPEST policies.		
PE-20	1	Physical and Environmental Protection Asset Monitoring and Tracking		Employ [Assignment: organization-defined asset location technologies] to track and monitor the location and movement of [Assignment: organization-defined assets] within [Assignment: organization-defined controlled areas].	Asset location technologies can help ensure that critical assets, including vehicles, equipment, or system components remain in authorized locations. Organizations consult with the Office of the General Counsel and senior agency official for privacy regarding the deployment and use of asset location technologies to address potential privacy concerns.	CM-8, PE-16, PM-8	
PE-21	1	Physical and Environmental Protection Electromagnetic Pulse Protection		Employ [Assignment: organization-defined controls] against electromagnetic pulse damage for [Assignment: organization-defined systems and system components].	An electromagnetic pulse (EMP) is a short burst of electromagnetic energy that is spread over a range of frequencies. Such energy bursts may be natural or man-made. EMP interference may be disruptive or damaging to electronic equipment. Protective measures used to mitigate EMP risk include shielding, surge suppressors, ferro-resonant transformers, and earth grounding.	PE-18, PE-19

		Prysical and Environmental Protection Component Marking		wark (x-x-signment: organization-terined system narroware components) indicating the impact teve of classification level of the information permitted to be processed, stored, or transmitted by the hardware component.	naroware components nat require marking include input coveres marked to micrate the classification of the network to which the devices are connected or a multifunction printer or copier residing in a classified area. Security marking refers to the use of human-readable security attributes. Security baleing refers to the use of security attributes for internal data structures within systems. Security marking is generally not required for hardware components processing, storing, or transmitting information determined by organizations to be in the public domain or to be publicly releasable. However, organizations may require markings for hardware components processing, storing, or transmitting public information indicating that such information is publicly releasable. Marking of system hardware components reflects applicable laws, executive orders, directives, policies, regulations, and standards.	10, MF-5	
PE-23	1	Physical and Environmental Protection Facility Location		 a. Plan the location or site of the facility where the system resides considering physical and environmental hazards; and b. For existing facilities, consider the physical and environmental hazards in the organizational risk management strategy. 	Physical and environmental hazards include floods, fires, tornados, earthquakes, hurricanes, terrorism, vandalism, electromagnetic pulse, electrical interference, and other forms of incoming electromagnetic radiation. The location of system components within the facility is addressed in PE-18.	CP-2, PE-18, PE-19, PM-8, PM-9, RA-3	
PL PL-1		Planning Policy and Procedures		a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more): organization-level; mission/business process-level; system-level] planning policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the planning policy and the associated planning controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the planning policy and procedures; and c. Review and update the current planning: 1. Policy [Assignment: organization-defined frequency]: 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the PL family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and privacy programs. Chiefer and privacy program solicies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy programs and for systems, if needed. Procedures describe how the policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizations. Procedure.	PM-9, PS-8, SI-12	
PL-2	1	Planning System Security and Privacy Plans		a. Develop security and privacy plans for the system that: 1. Are consistent with the organization's enterprise architecture; 2. Explicitly define the constituent system components; 3. Describe the operational context of the system in terms of missions and business processes; 4. Provide the security categorization of the system, including supporting rationale; 5. Describe any specific threats to the system that are of concern to the organization; 6. Provide the results of a privacy risk assessment for systems processing personally identifiable information; 6. Provide the results of a privacy risk assessment for systems processing personally identifiable information; 7. Describe the operational environment for the system and any dependencies on or connections to other systems or system components; 8. Provide an overview of the security and privacy requirements for the system; 9. Identify any relevant control baselines or overlays, if applicable; 10. Describe the controls in place or planned for meeting the security and privacy requirements, including a rationale for any talloring decisions; 11. Include risk determinations for security and privacy architecture and design decisions; 12. Include security- and privacy-related activities affecting the system that require planning and coordination with [Assignment: organization-defined individuals or groups]; and 13. Are reviewed and approved by the authorizing official or designated representative prior to plan implementation. b. Distribute copies of the plans and communicate subsequent changes to the plans to [Assignment: organization-defined frequency]; d. Update the plans to address changes to the system and environment of operation or problems identified during plan implementation or control assessments; and e. Protect the plans from unauthorized disclosure and modification.	selected to satisfy the requirements. The plans describe the intended application of each selected control in the content of the system with a sufficient level of death to correctly implement the control and to subsequently suspens the effectiveness of the CONTROL. The control documentation describes how system-specific and hybrid controls are implemented and the plans and development of system in support of it to epic based excuritly engineeting processes. Spelins accurity and privacy plans are living documents that are updated and adapted throughout the system development life cycle, for example, during capability determination, analysis of laternatives, requested for proposal, and design growers. Section 2.1 describes the different types of requirements that are relevant to organizations during the system development life cycle and the relationship between requirements and accurate an application special country and privacy plans relationship to the control of the country of privacy plans relationship to the control of the country and privacy plans relate searchy and privacy requirements to a set of control and control or shancements. The plans describe how the control and relationship between the security and privacy plans related assembly and privacy requirements and one of provide detailed, extended description of the design of the design of the design of the control of the design of the	AC-2, AC-6, AC-14, AC 17, AC-20, CA-2, CA- 17, AC-20, CA-2, CA- 13, CP-2, CP-4, IR-4, IR-6, IM-4, IM-5, IR-6, IM-4, IM-5, IM-7, IM-7	
PL-2 (1)	2	Planning System Security and Privacy Plans	Х				[Withdrawn: Incorporated into PL-7]
PL-2 (2)	2	Concept of Operations Planning System Security and Privacy Plans	Х				[Withdrawn: Incorporated into PL-8]
PL-2 (3)	2	Functional Architecture Planning System Security and Privacy Plans Plan and Coordinate with Other Organizational Entities	Х				[Withdrawn: Incorporated into PL-2]
PL-3	1	Planning System Security Plan Update	х				[Withdrawn: Incorporated into PL-2]
PL-4	1	Planning Rules of Behavior		a Establish and provide to individuals requiring access to the system, the rules that describe their responsibilities and expected behavior for information and system usage, security, and privacy; b. Receive a documented acknowledgment from such individuals, indicating that they have read, understand, and agree to abide by the rules of behavior, before authorizing access to information and the system; c. Review and update the rules of behavior [Assignment: organization-defined frequency]; and d. Require individuals who have acknowledged a previous version of the rules of behavior to read and reacknowledge [Selection (one or more): [Assignment: organization-defined frequency]; when the rules are revised or updated].	hypes of access agreements include nondisclosure agreements, conflict-of-interest agreements, and acceptable use agreements (see PS-6). Organizations consider rules of behavior based on individual user roles and responsibilities, and differentiating, for example, between rules that apply to privileged users and rules that apply to general users. Establishing rules of behavior for some types of non-organizational users, including individuals who simply receive information from federal systems, is often not feasible given the large number of such users and the limited nature of their interactions with the systems. Rules of behavior for organizational and non-organizational users can also be established in AC-8. The related controls section provides a list of controls that are relevant to organizational rules of behavior. PL-4b, the documented acknowledgment portion of the control, may be established by the avaerness training and role-based training programs conducted by organizations if such training includes rules of behavior. Documented acknowledgments for rules of behavior include electronic or physical signatures; and electronic agreement check boxes or radio buttons.	AC-2, AC-6, AC-8, AC- 9, AC-17, AC-18, AC- 19, AC-20, AT-2, AT- 3, CM-11, IA-2, IA-4, IA-5, MP-7, P5-6, P5- 8, SA-5, SI-12	
PL-4 (1)	2	Planning Rules of Behavior Social Media and External Site/application Usage Restrictions		Include in the rules of behavior, restrictions on: (a) Use of social media, social networking sites, and external sites/applications; (b) Posting organizational information on public websites; and (c) Use of organization-provided credentials (i.e., email addresses) for creating accounts on external sites/applications.	Social media, social networking, and external site/application usage restrictions address rules of behavior related to the use of these sites when organizational personnel are using such sites for official duties or in the conduct of official business, when organizational information is involved in social media and networking transactions; and when personnel are accessing social media and networking sites from organizational systems. Organizational abo address specific rules that prevent unauthorized entitles from obtaining, either directly or through inference, non-public organizational information from social media and networking sites. Non-public information includes, for example, personally identifiable information and system account information.	AC-22, AU-13	
PL-5	1	Planning Privacy Impact Assessment	х				[Withdrawn: Incorporated into RA-8]
PL-6		Planning Security-related Activity Planning	X				[Withdrawn: Incorporated into PL-2]

Control ID	Laurel	Control Name	hdrawn	Control Text	Planuslas	Deleted Controls	Metro
PL-7	1	Control Name With Planning Concept of Operations	ndrawn	Control Execution Concept of Operations (CONOPS) for the system describing how the organization intends to operate the system from the perspective of information security and privacy, and b. Review and update the CONOPS [Assignment: organization-defined frequency].	The CONDPS may be included in the security or privacy plans for the system or in other system development life cycle documents. The CONDPS is a living document that requires updating throughout the system development life cycle. For example, during system design reviews, the concept of operations is checked to ensure that it remains consistent with the design for controls, the system architecture, and the operational procedures. Changes to the CONDPS are reflected in ongoing updates to the security and privacy plans, security and privacy architectures, and other appropriate organizational documents, for example, procurement specifications, system development life cycle documents, and systems engineering documents.	Related Controls PL-2, SA-2, SI-12	Notes
PL-S	í	Planning Security and Privacy Architectures		a. Develop security and privacy architectures for the system that: 1. Describe the requirements and approach to be taken for protecting the confidentiality, integrity, and availability of organizational information; 2. Describe the requirements and approach to be taken for processing personally identifiable information to minimize privacy risk to individuals; 3. Describe how the architectures are integrated into and support the enterprise architecture; and 4. Describe any assumptions about, and dependencies on, external systems and services; b. Review and update the architectures [Assignment: organization-defined frequency] to reflect changes in the enterprise architecture; and c. Reflect planned architecture changes in the security and privacy plans, the Concept of Operations (CONOPS), organizational procedures, and procurements and acquisitions.	architectures described in PM-7 that are integral to and developed as part of the enterprise architecture. The architectures include an architectural description, the allocation of security and privacy functionality (included controls) security- and privacy-related information for external interfaces, information being exchanged across	CM-2, CM-6, PL-2, PL 7, PL-9, PM-5, PM-7, RA-9, SA-3, SA-5, SA- 8, SA-17	
PL-8 (1)	2	Planning Security and Privacy Architectures Defense-in-depth		Design the security and privacy architectures for the system using a defense-in-depth approach that: (a) Allocates (Assignment: organization-defined controls) to (Assignment: organization-defined locations and architectural loyers); and (b) Ensures that the allocated controls operate in a coordinated and mutually reinforcing manner.	Organizations strategically allocate security and privacy controls in the security and privacy architectures so that adversaries must overcome multiple controls to achieve their objective. Requiring adversaries to defeat multiple controls makes it more difficult to attack information resources by increasing the work factor of the adversary; and increases the likelihood of detection. The coordination of allocated controls is essential to ensure that an attack that involves one control does not create adverse unintended consequences by interfering with other controls. Unintended consequences can include system lockout and accosading alarms. The placement of controls in systems and organizations is an important activity requiring thoughtful analysis. The value of organizational assets is an important consideration in providing additional layering. Defense-in-depth architectural approaches include modulatry and layering (see SA-81)), seeps (see SA-81); septimal organization of system and user functionality (see SC-2); and security function isolation (see SC-3).		
PL-8 (2)	2	Planning Security and Privacy Architectures Supplier Diversity		Require that [Assignment: organization-defined controls] allocated to [Assignment: organization-defined locations and architectural layers] are obtained from different suppliers.	Information technology products have different strengths and weaknesses. Providing a broad spectrum of products complements the individual offerings. For example, vendors offering malicious code protection typically update their products at different times, often developing solutions for known viruses, Trojans, or worms based on their priorities and development schedules. By deploying different products at different locations, there is an increased likelihood that at least one of the products will detect the malicious code. With respect to privacy, vendors may offer products that track personally identifiable information in systems. Products may use different tracking methods. Using multiple products may result in more assurance that personally identifiable information is inventoried.	SC-29, SR-3	
PL-9	1	Planning Central Management		Centrally manage [Assignment: organization-defined controls and related processes].	Central management refers to organization-wide management and implementation of selected controls and processes. This includes planning, implementing, assessing, authorizing, and monitoring the organization-defined, centrally managed controls and processes. As the central management of controls is generally associated with the concept of common (inherted) controls, such management promotes and facilitates standardization of control implementations and management and judicious use of organizational resources. Centrally-managed controls and processes may also meet in dependence requirements for assessments in support of initial and ongoing authorizations to operate and as part of organizational continuous monitoring. As part of the control selection processes, organizations determine the controls that may be suitable for central management based on resources and capabilities. It is not always possible to centrally manage every aspect of a control. In such cases, the control can be treated as a hybrid control with the control managed and implemented centrally or at the system level. The controls and control enhancements that are candidates for full or partial central management include, but are not limited to: AC-2(1), AC-2(2), AC-2(3), AC-2(4), AC-2(1), AC-2(2), AC-1(3), AC-1(3), AC-1(3), AC-1(3), AC-1(3), AC-3(4),	PL-8, PM-9	

		Control Name Withdrawn	Control Text		
Pi-10	1	Planning Baseline Selection	Select a control baseline for the system.	control baselines are pre-defined sets of controls specifically assembled to address the protection needs of a group, organization, or community of interest. Controls are chosen for baselines either to satisfy mandates imposed by laws, executive orders, directives, regulations, policies, standards, or guidelines; or to address threats common to all users of the baseline under the assumptions specific to the baseline. Baselines represent a starting point for the protection of individuals' privacy, information, and information systems, with subsequent tailoring actions to manager sirk in accordance with mission, business, or other constraints (see Pt-11). Federal control baselines are provided in ISP 800-538]. The selection of a control baseline is determined by the needs of stakeholders. Stakeholder needs consider mission and business requirements and as well as mandates imposed by applicable laws, executive orders, directives, policies, regulations, standards, and guidelines for example, the control baselines in ISP 800-538] are based on the requirements from [FiSMA] and [PRIVACT]. The requirements, along with the NIST standards and guidelines implementing the legislation, direct organizations to select one of the control baselines after the reviewing the information types and the information that is processed, stored, and transmitted on the system; analyzing the potential adverse impact of the loss or compromise of the information or system on the organization's operations and assets, individuals, other organizations or the Nation; and considering the results from system and organizational risk assessments.	
PL-11		Planning Baseline Tailoring	Tailor the selected control baseline by applying specified tailoring actions.	The concept of tailoring allows organizations to specialize or customize a set of baseline controls by applying a defined set of tailoring actions. Tailoring actions facilitate such specialization and customization by allowing organizations to develop security and privacy plans that reflect their specific missions and business functions, the environments where their systems operate, the threats and vulnerabilities that can affect their systems, and any other conditions or situations that can impact their mission or business success. Tailoring guidance is provided in 159 800-538]. Tailoring a control baseline is accomplished by identifying and designating common controls, applying scoping considerations; selecting compensating controls; assigning values to control parameters, supplementing the control baseline with additional controls, as needed; and providing information for control implementation. The general tailoring actions in [SP 800-538] can be supplemented with additional actions based on the needs of organizations. Tailoring actions can be applied to the baselines in ISP 800-538] in accordance with the security and privacy requirements from [FSNA9] and [PRINACT]. Hatmatubey, other communities of interest adopting different control baselines can apply the tailoring actions in ISP 800-538] to specialize or customize the controls that represent the specific needs and concerns of those entities.	PL-10, RA-2, RA-3, RA-9, SA-S
PM-1		Program Management Information Security Program Plan	a. Develop and disseminate an organization-wide information security program plan that: 1. Provides an overview of the requirements for the security program and a description of the security program management controls and common controls in place or planned for meeting those requirements; 2. Includes the identification and assignment of roles, responsibilities, management commitment, coordination among organizational entities, and compliance; 3. Reflects the coordination among organizational entities responsible for information security; and 4. Is approved by a senior official with responsibility and accountability for the risk being incurred to organizational operations (including mission, functions, image, and reputation), organizational assets, individuals, other organizations, and the Nation; 6. Review the organization-wide information security program plan [Assignment: organization-defined frequency]; c. Update the information security program plan to address organizational changes and problems identified during plan implementation or control assessments; and d. Protect the information security program plan from unauthorized disclosure and modification.		
PM-2	1	Program Management Information Security Program Leadership Role	Appoint a senior agency information security officer with the mission and resources to coordinate, develop, implement, and maintain an organization-wide information security program.	The senior agency information security officer is an organizational official. For federal agencies (as defined by applicable laws, executive orders, regulations, directives, policies, and standards), this official is the senior agency information security officer. Organizations may also refer to this official as the senior information security officer or chief information security officer.	
PM-3		Program Management Information Security and Privacy Resources	a. Include the resources needed to implement the information security and privacy programs in capital planning and investment requests and document all exceptions to this requirement; b. Prepare documentation required for addressing information security and privacy programs in capital planning and investment requests in accordance with applicable laws, executive orders, directives, policies, regulations, standards; and c. Make available for expenditure, the planned information security and privacy resources.	Organizations consider establishing champions for information security and privacy and as part of including the necessary resources, assign specialized expertise and resources as needed. Organizations may designate and empower an investment Review Board or similar group to manage and provide oversight for the information security and privacy aspects of the capital planning and investment control process.	
PM-4	1	Program Management Plan of Action and Millestones Process	a. Implement a process to ensure that plans of action and milestones for the information security and privacy programs and associated organizational systems: 1. Are developed and maintained; 2. Document the remedial information security and privacy actions to adequately respond to risk to organizational operations and assests, individuals, other organizations, and the Nation; and 3. Are reported in accordance with established reporting requirements. b. Review plans of action and milestones for consistency with the organizational risk management strategy and organization-wide priorities for risk response actions.	The plan of action and milestones is a key document in the information security and privacy programs of organizations and is subject to reporting requirements established by the Office of Management and Budget. Organizations view plans of action and milestones from an organization-wide perspective, prioritizing risk response actions and ensuring consistency with the goals and objectives of the organization. Plan of action and milestones updates are based on findings from control assessments and continuous monitoring activities. There can be multiple levels of plan of action and milestones documents corresponding to the information system level, mission/business process level, and organization/giveorrance level. While the plan of action and milestones is required for federal organizations, any type of organization can help reduce risk by documenting and tracking planned remediations. Specific guidance on plans of action and milestones for organizational systems in described in CA-5.	7, SI-12
PM-5	1	Program Management System Inventory	Develop and update [Assignment: organization-defined frequency] an inventory of organizational systems.	[OMB A-130] provides guidance on developing systems inventories and associated reporting requirements. This control refers to an organization-wide inventory of systems, not system components as described in CM-8.	

Control ID	l avel	Control Name Withdrawn	Control Text	Discussion	Related Controls	Notes
PM-5 (1)	2	Control Name Program Management System Inventory Inventory of Personally Identifiable Information	Control Text Establish, mointain, and update [Assignment: organization-defined frequency] an inventory of all systems, applications, and projects that process personally identifiable information.		Related Controls CM-8, CM-12, CM- 13, PL-8, PM-22, PT- 3, PT-6, SI-12, SI-18	
PM-6	1	Program Management Measures of Performance	Develop, monitor, and report on the results of information security and privacy measures of performance.	Measures of performance are outcome-based metrics used by an organization to measure the effectiveness or efficiency of the information security and privacy programs and the controls employed in support of the program.	CA-7	
PM-7		Program Management Enterprise Architecture	Develop and maintain an enterprise architecture with consideration for information security, privacy, and the resulting risk to organizational operations and assets, individuals, other organizations, and the Nation.	The integration of security and privacy requirements and controls into the enterprise architecture helps to ensure that security and privacy considerations are addressed throughout the system development life cycle and are explicitly related to the organization's mission and business processes. The process of security and privacy requirements integration also embeds into the enterprise architecture, the organization's security and privacy architectures consistent with the organizational risk management strategy. For PM-7, security and privacy architectures are developed at a level representing an individual system. The system-level architectures are developed at a level representing an individual system. The system-level architectures are consistent with the security and privacy architectures defined for the organization. Security and privacy requirements and control integration are most effectively accomplished through the rigorous application of the Risk Management Framework [SP 800 37] and supporting security standards and guidelines.		
PM-7 (1)	2	Program Management Enterprise Architecture Offloading	Offload [Assignment: organization-defined non-essential functions or services] to other systems, system components, or an external provider.	Not every function or service a system provides is essential to an organization's missions or business operations. Printing or copying is an easingle of a non-essential but supporting service for an organization. Whenever feasible, such supportive but non-essential functions or services are not co-located with the functions or services supporting essential missions or business operations. Maintaining such functions on the same system or system component increases the attack surface of the organization's mission essential functions or services. Moving supportive but non-essential functions to a non-critical system, system component, or external provider can also increase efficiency by putting those functions or services under the control of individuals or providers who are subject matter experts in the functions or services.	SA-8	
PM-8	1	Program Management Critical Infrastructure Plan	Address information security and privacy issues in the development, documentation, and updating of a critical infrastructure and key resources protection plan.	requirement and guidance for defining critical infrastructure and key resources and for	CP-2, CP-4, PE-18, PL- 2, PM-9, PM-11, PM- 18, RA-3, SI-12	
PM-9	1	Program Management Risk Management Strategy	a. Develops a comprehensive strategy to manage: 1. Security risk to organizational operations and assets, individuals, other organizations, and the Nation associated with the operation and use of organizational systems; and 2. Privacy risk to individuals resulting from the authorized processing of personally identifiable information; b. Implement the risk management strategy consistently across the organization; and c. Review and update the risk management strategy [Assignment: organization-defined frequency] or as required, to address organizational changes.	acceptable risk assessment methodologies; a process for evaluating security and privacy risk across the organization vist herepare to the organization vist kolerance; and approaches for monitoring risk over time. The senior accountable official for risk management (agency head or designated official) aligns information security management processes with strategic, operational, and budgetary planning processes. The risk executive function, led by the senior accountable official for risk management, can facilitate consistent application of the risk management strategy can be informed by security and privacy six-leated inputs from other sources, both internal and	1, CA-2, CA-5, CA-6, CA-7, CM-1, CP-1, IA- 1, IR-1, MA-1, MP-1, PE-1, PL-1, PL-2, PM- 2, PM-8, PM-18, PM- 28, PM-30, PS-1, PT-	
PM-10	1	Program Management Authorization Process	a. Manage the security and privacy state of organizational systems and the environments in which those system operate through authorization processes; b. Designate individuals to fulfill specific roles and responsibilities within the organizational risk management process; and c. Integrate the authorization processes into an organization-wide risk management program.	Authorization processes for organizational systems and environments of operation require the implementation of an organization-wide risk management process and associated security and privacy standards and guidelines. Specific roles for risk management processes include a risk executive (function) and designated authorizing officials for each organizational system and common control provider. The organizational authorization processes are integrated with continuous monitoring processes to facilitate ongoing understanding and acceptance of security and privacy risks to organizational operations, organizational assets, individuals, other organizations, and the Nation.		
PM-11	1	Program Management Mission and Business Process Definition	a. Define organizational mission and business processes with consideration for information security and privacy and the resulting risk to organizational operations, organizational assets, individuals, other organizations, and the Nation, and D. Determine information protection and personally identifiable information processing needs arising from the defined mission and business processes; and c. Review and revise the mission and business processes [Assignment: organization-defined frequency].	Protection needs are technology-independent, required capabilities to counter threats to organizations, individuals, systems, and the Nation through the compromise of information (i.e., loss of confidentiality, integrity, availability, or privacy). Information protection and personally identifiable information processing needs are derived from the mission and business needs defined by the stakeholders in organizations, the mission and business processes defined to meet those needs, and the organizational risk management strategy, information protection and personally identifiable information processing needs determine the required controls for the organization and the systems, Inherent in defining protection and personally identifiable information processing needs, is an understanding of adverse impact that could result if a compromise or breach of information occurs. The categorization process is used to make such potential impact determinations. Privacy risks to individuals can arise from the compromise of personally identifiable information, but they can also arise as unintended consequences or a byproduct of authorized processing of information at any stage of the data life cycle. Privacy risk assessments are used to prioritize the risks that are created for individuals from system processing of personally identifiable information. These risk assessments enable the selection of the required privacy controls for the organization and systems. Mission and business process definitions and the associated protection requirements are documented in accordance with organizational policy and procedures.		

Control ID Level Control Name PM-12 1 Program Management Insider Threat Program	ndrawn Control Text			
PW-12 1 Program Management Insider Threat Program		Discussion	Related Controls	Notes
	Implement an insider threat program that includes a cross-discipline insider threat incident handling team.	Organizations handling classified information are required, under Executive Order 13587 [EO	AC-6, AT-2, AU-6, AU-	
		13587] and the National Insider Threat Policy [ODNI NITP], to establish insider threat programs.	7, AU-10, AU-12, AU-	
		The same standards and guidelines that apply to insider threat programs in classified	13, CA-7, IA-4, IR-4,	
		environments can also be employed effectively to improve the security of controlled unclassified	MP-7, PE-2, PM-16,	
		and other information in non-national security systems. Insider threat programs include controls	PS-3, PS-4, PS-5, PS-	
		to detect and prevent malicious insider activity through the centralized integration and analysis	7. PS-8. SC-7. SC-38.	
		of both technical and non-technical information to identify potential insider threat concerns. A	SI-4. PM-14	
		senior official is designated by the department or agency head as the responsible individual to	51 4, 1 111 24	
		implement and provide oversight for the program. In addition to the centralized integration and		
		analysis capability, insider threat programs require organizations to prepare department or		
		agency insider threat policies and implementation plans; conduct host-based user monitoring of		
		individual employee activities on government-owned classified computers: provide insider threat		
		awareness training to employees: receive access to information from offices in the department		
		or agency for insider threat analysis; and conduct self-assessments of department or agency		
		insider threat posture.		
		Insider threat programs can leverage the existence of incident handling teams that organizations		
		may already have in place, such as computer security incident response teams. Human resources		
		records are especially important in this effort, as there is compelling evidence to show that some		
		types of insider crimes are often preceded by nontechnical behaviors in the workplace, including		
		ongoing patterns of disgruntled behavior and conflicts with coworkers and other colleagues.		
		These precursors can guide organizational officials in more focused, targeted monitoring efforts.		
		However, the use of human resource records could raise significant concerns for privacy. The		
		participation of a legal team, including consultation with the senior agency official for privacy,		
		ensures that monitoring activities are performed in accordance with applicable laws, executive		
		orders, directives, regulations, policies, standards, and guidelines.		
		 		
PM-13 1 Program Management Security and Privacy	Establish a security and privacy workforce development and improvement program.	Security and privacy workforce development and improvement programs include defining	AT-2, AT-3	
Workforce		the knowledge, skills, and abilities needed to perform security and privacy duties and tasks;		
		developing role-based training programs for individuals assigned security and privacy roles		
		and responsibilities; and providing standards and guidelines for measuring and building		
		individual qualifications for incumbents and applicants for security- and privacy-related		
		positions. Such workforce development and improvement programs can also include		
		security and privacy career paths to encourage security and privacy professionals to		
		advance in the field and fill positions with greater responsibility. The programs encourage		
		organizations to fill security- and privacy-related positions with qualified personnel. Security		
		and privacy workforce development and improvement programs are complementary to		
		organizational security awareness and training programs and focus on developing and		
		institutionalizing the core security and privacy capabilities of personnel needed to protect		
		organizational operations, assets, and individuals.		
PM-14 1 Program Management Testing, Training, and	a. Implement a process for ensuring that organizational plans for conducting security and privacy testing,	This control ensures that organizations provide oversight for testing, training, and	AT-2, AT-3, CA-7, CP-

PM-16 (1) 2 Program Management Threat Awareness Program Automated Means for Sharing Threat Intelligence	Implement a threat awareness program that includes a cross-organization information-sharing capability for threat intelligence. Employ automated mechanisms to maximize the effectiveness of sharing threat intelligence information. a. Establish policy and procedures to ensure that requirements for the protection of controlled unclassified	functions. Organizations share threat, vulnerability, and incident information as well as contextual insights, compliance techniques, and privacy problems consistent with applicable laws, executive orders, directives, policies, regulations, standards, and guidelines. Because of the constantly changing and increasing sophistication of adversaries, especially the advanced persistent threat (APT), it may be more likely that adversaries can successfully breach or compromise organizational systems. One of the best techniques to address this concern is for organizations to share threat information including threat events (i.e., tactics, techniques, and procedures) that organizations have experienced; mitigations that organizations have found are effective against certain types of threats; and threat intelligence (i.e., indications and warnings about threats). Threat information sharing may be bilateral or multilateral. Blateral threat sharing includes powerment-to-commercial and government-to-government cooperatives. Multilateral threat sharing includes organizations taking part in threat-sharing consortia. Threat information may be highly sensitive requiring special agreements and protection, or less sensitive and freely shared. To maximize the effectiveness of monitoring, it is important to know what threat observables and indicators the sensors need to be searching for. By utilizing well established frameworks, services, and automated tools, organizations improve their ability to rapidly shore and feed into monitoring tools, the relevant threat detection signatures.

PM-23	1	Program Management Data Governance Body	Establish a Data Governance Body consisting of [Assignment: organization-defined roles] with [Assignment: organization-defined responsibilities].	A Data Governance Body can help ensure that the organization has coherent policies and the ability to balance the utility of data with security and privacy requirements. The Data Governance Body establishes policies, procedures, and standards that facilitate data governance so that data, including personally identifiable information, is effectively managed and maintained in accordance with applicable laws, security orders, directives, regulations, policies, standards, and guidance. Responsibilities can include developing and implementing guidelines supporting data modeling, quality, integrity, and de-identification needs of personally identifiable information across the information life cycle and reviewing and approving applications to release data outside of the organization, archiving the applications and the released data outside of the organization, archiving the applications and the released data, and performing post-release monitoring to ensure that the assumptions made as part of the data release continue to be valid. Members include the chief information officer, senior agency information security officer, and secinic augency official for privacy. Federal agencies are required to establish a Data Governance Body with specific coles and responsibilities in accordance with the [EVIDACT] and policies set forth under [OMB M-19-23].	AT-2, AT-3, PM-19, PM-22, PM-24, PT-8, SI-4, SI-19	
PM-24	1	Program Management Data Integrity Board	Establish a Data Integrity Board to: a. Review proposals to conduct or participate in a matching program; and b. Conduct an annual review of all matching programs in which the agency has participated.	A Data Integrity Board is the board of senior officials designated by the head of a federal agency that is responsible for, among other things, reviewing the agency's proposals to conduct or participate in a matching program and conducting an annual review of all matching programs in which the agency has participated. As a general matter, a matching program is a computerized comparison of records from two or more automated [PRINACT] systems of records, or a automated system of records and automated records analyticated by a non-federal agency (or agent thereof). A matching program lether pertains to Federal benefit programs or Federal personnel or payroll records. At a minimum, the Data Integrity Board includes the Inspector General of the agency, if any, and the senior agency official for privacy.		
PM-25	1	Program Management Minimization of Pii Used in Testing, Training, and Research	a. Develop, document, and implement policies and procedures that address the use of personally identifiable information for internal testing, training, and research; b. Limit or minimize the amount of personally identifiable information used for internal testing, training, and research purposes; c. Authorize the use of personally identifiable information when such information is required for internal testin training, and research; and d. Review and update policies and procedures [Assignment: organization-defined frequency].	avoid exposure of personally identifiable information when conducting testing, training, and research. The use of live data for testing, training, and research is also addressed in SA-3(2).	PM-23, PT-3, SA-3	
PM-26		Program Management Complaint Management	Implement a process for receiving and responding to complaints, concerns, or questions from individuals about the organizational privacy practices that includes: a. Mechanisms that are easy to use and readily accessible by the public; b. All information necessary for successfully filing complaints; c. Tracking mechanisms to ensure all complaints received are reviewed and addressed within [Assignment: organization-defined time-period]; d. Acknowledgement of receipt of complaints, concerns, or questions from individuals within [Assignment: organization-defined time-period]; and e. Response to complaints, concerns, or questions from individuals within [Assignment: organization-defined time-period].	t Complaints, concerns, and questions from individuals can serve as a valuable source of input to organizations that ultimately improves operational models, uses of technology, data collection practices, and controls. Mechanisms that can be used by the public include telephone hotline, email, or web-based forms. The information necessary for successfully filing complaints includes contact information for the senior agency official for privacy or other official designated to receive complaints. Privacy complaints may also include personally identifiable information.	IR-7, IR-9, PM-22, SI- 18	
PM-27	1	Program Management Privacy Reporting	a. Develop [Assignment: organization-defined privacy reports] and disseminate to: 1. OMB, Congress, and other oversight bodies to demonstrate accountability with statutory, regulatory, and policy privacy mandates; and 2. [Assignment: organization-defined officials] and other personnel with responsibility for monitoring privacy program compliance; and b. Review and update privacy reports [Assignment: organization-defined frequency].	Through internal and external reporting, organizations promote accountability and transparency in organizational privacy operations. Reporting can also help organizations to determine progress in meeting privacy compliance requirements and privacy controls, compare performance across the federal government, discover vulnerabilities, identify goin policy and implementation, and identify models for success. Privacy reports include annual senior agency official for privacy reports to OMB; reports to Congress required by implementing Regulations of the 9/11 Commission Act; and other public reports required by law, regulation, or policy, including internal policies of organizations. The senior agency official for privacy consults with legal counsel, where appropriate, to ensure that organizations meet all applicable privacy reporting requirements.	IR-9, PM-19	
PM-28	1	Program Management Risk Framing	a. Identify and document: 1. Assumptions affecting risk assessments, risk responses, and risk monitoring; 2. Constraints affecting risk assessments, risk responses, and risk monitoring; 3. Priorities and trade-offs considered by the organization for managing risk; and 4. Organizational risk tolerance; and D. Distribute the results of risk framing activities to [Assignment: organization-defined personnel]; C. Review and update risk framing considerations [Assignment: organization-defined frequency].	constraints, risk tolerance, priorities, and tradeoffs identified as part of the risk framing process, inform the risk management strategy which in turn, informs the conduct of risk assessment, risk response, and risk monitoring activities. Risk framing results are shared with organizational personnel including mission/business owners, information owners or stewards, system owners, authorizing officials, senior agency information security officer, senior agency official for privacy, and senior accountable official for risk management.	CA-7, PM-9, RA-3, RA-7	
PM-29	1	Program Management Risk Management Program Leadership Roles	a. Appoint a Senior Accountable Official for Risk Management to align organizational information security and privacy management processes with strategic, operational, and budgetary planning processes; and b. Establish a Risk Executive (function) to view and analyze risk from an organization-wide perspective and ensure management of risk is consistent across the organization.	The senior accountable official for risk management leads the risk executive (function) in organization-wide risk management activities.	PM-2, PM-19	
PM-30	1	Program Management Supply Chain Risk Management Strategy	Develop an organization-wide strategy for managing supply chain risks associated with the development, acquisition, maintenance, and disposal of systems, system components, and system services; b. Implement the supply chain risk management strategy consistently across the organization; and c. Review and update the supply chain risk management strategy on [Assignment: organization-defined frequency] or as required, to address organizational changes.	An organization-wide supply chain risk management strategy includes an unambiguous expression of the supply chain risk tolerance for the organization, acceptable supply chain risk mitigation strategies or controls, a process for consistently evaluating and monitoring supply chain risk, approaches for implementing and communicating the supply chain risk management strategy, and the associated roles and responsibilities. Supply chain risk management includes considerations of both security and privacy risk associated with the development, acquisition, maintenance, and disposal of systems, system components, and system services. The supply chain risk management strategy can be incorporated into the organization's overarching risk management strategy and can guide and inform the system-level supply chain risk management plan. The use of a risk executive function can facilitate consistent, organization-wide application of the supply chain risk management strategy. The supply chain risk management strategy is implemented at the organizational level, whereas the supply chain risk management strategy is implemented at the system-level.

PS-4	1	Control Name Withdrawn Personnel Security Personnel Termination	Control Text Upon termination of individual employment: a. Disable system access within [Assignment: organization-defined time-period]; b. Terminate or revoke any authenticators and credentials associated with the individual; c. Conduct exit interviews that include a discussion of [Assignment: organization-defined information security topics]; d. Retrieve all security-related organizational system-related property; and e. Retain access to organizational information and systems formerly controlled by terminated individual.	Discussion System property includes hardware authentication tokens, system administration technical manuals, keys, identification cards, and building passes. Exit interviews ensure that terminated individuals understand the security constraints imposed by being former employees and that proper accountability is achieved for system-related property. Security topics at exit interviews include reminding individuals of nondisclosure agreements and potential limitations on future employment. Exit interviews may not always be possible for some individuals including in cases related to unavailability of supervisors, illnesses, or job abandomment. Exit interviews employment for individuals with security dearances. Timely execution of termination actions is essential for individuals who have been terminated for cause. In certain situations, organizations consider disabiling system accounts of individuals that are being terminated prior to the individuals being notified.	12, PS-6, PS-7	NOCS -
PS-4 (1)		Personnel Security Personnel Termination Post- employment Requirements	(a) Notify terminated individuals of applicable, legally binding post-employment requirements for the protection of organizational information; and (b) Require terminated individuals to sign an acknowledgment of post-employment requirements as part of the organizational termination process.	employment requirements on terminated individuals.		
PS-4 (2)	2	Personnel Security Personnel Termination Automated Notification	Notify [Assignment: organization-defined personnel or roles] of individual termination actions using [Assignment: organization-defined automated mechanisms].	In arganizations with many employees, not all personnel who need to know about termination actions receive the appropriate notifications—or, if such notifications are received, they may not occur in a timely manner. Automated mechanisms can be used to send automatic alerts or notifications to arganizational personnel or roles when individuals are terminated. Such automatic alerts or notifications can be conveyed in a variety of ways, including telephonically, via electronic mail, via text message, or via websites.		
PS-5	1	Personnel Security Personnel Transfer	a. Review and confirm ongoing operational need for current logical and physical access authorizations to systems and facilities when individuals are reassigned or transferred to other positions within the organization; b. Initiate [Assignment: organization-defined transfer or reassignment actions] within [Assignment: organization defined time-period following the formal transfer action]; c. Modify access authorization as needed to correspond with any changes in operational need due to reassignment or transfer; and d. Notify [Assignment: organization-defined personnel or roles] within [Assignment: organization-defined time-period].	Personnel transfer applies when reassignments or transfers of individuals are permanent or of such extended durations as to make the actions warranted. Organizations define actions appropriate for the types of reassignments or transfers, whether permanent or extended. Actions that may be required for personnel transfers or reassignments to other positions within organizations include returning old and issuing new keys, identification cards, and building passes; closing system accounts and establishing new accounts; changing system access authorizations (i.e., privileges); and providing for access to official records to which individuals had access at previous work locations and in previous system accounts.		
PS-6	1	Personnel Security Access Agreements	a. Develop and document access agreements for organizational systems; b. Review and update the access agreements [Assignment: organization-defined frequency]; and c. Verify that individuals requiring access to organizational information and systems: 1. Sign appropriate access agreements prior to being granted access; and 2. Re-sign access agreements to maintain access to organizational systems when access agreements have been updated or [Assignment: organization-defined frequency].	Access agreements include nondisclosure agreements, acceptable use agreements, rules of behavior, and conflict-of-interest agreements. Signed access agreements include an acknowledgement that individuals have read, understand, and agree to abide by the constraints associated with organizational systems to which access is authorized. Organizations can use electronic signatures to acknowledge access agreements unless specifically prohibited by organizational policy.	AC-17, PE-2, PL-4, PS- 2, PS-3, PS-6, PS-7, PS 8, SA-21, SI-12	
PS-6 (1)	2	Personnel Security Access Agreements Information X Requiring Special Protection				[Withdrawn: Incorporated into PS-3]
PS-6 (2)	2	Requiring Special Florection Personnel Security Access Agreements Classified Information Requiring Special Protection	Verify that access to classified information requiring special protection is granted only to individuals who: (a) Have a valid access authorization that is demonstrated by assigned official government duties; (b) Satisfy associated personnel security criteria, and (c) Have read, understood, and signed a nondisclosure agreement.	Classified information requiring special protection includes collateral information, Special Access Program (SAP) information, and Sensitive Compartmented Information (SCI). Personnel security criteria reflect applicable laws, executive orders, directives, regulations, policies, standards, and guidelines.		
PS-6 (3)		Personnel Security Access Agreements Post- employment Requirements	(a) Notify individuals of applicable, legally binding post-employment requirements for protection of organizational information; and (b) Require individuals to sign an acknowledgment of these requirements, if applicable, as part of granting initia access to covered information.	Organizations consult with the Office of the General Counsel regarding matters of post- employment requirements on terminated individuals.	PS-4	
PS-7		Personnel Security External Personnel Security	a. Establish personnel security requirements, including security roles and responsibilities for external providers; b. Require external providers to comply with personnel security policies and procedures established by the organization; c. Document personnel security requirements; c. Document personnel security requirements; d. Require external providers to notify [Assignment: organization-defined personnel or roles] of any personnel transfers or terminations of external personnel who possess organizational credentials and/or badges, or who have system privileges within [Assignment: Organization-defined inter-period]; and e. Monitor provider compliance with personnel security requirements.	the system. External providers include service bureaus, contractors, and other organizations providing system development, information technology services, testing or assessment services, outsourced applications, and network/security management. Organizations explicitly include personnel security requirements in acquisition-related documents. External providers may have personnel working at organizational facilities with credentials, badges, or system privileges issued by organizations. Notifications of external personnel changes ensure appropriate termination of privileges and credentials. Organizations define the transfers and terminations deemed reportable by security-related characteristics that include functions, roles, and nature of credentials or privileges associated with individuals transferred or terminated.	3, PS-2, PS-3, PS-4, PS 5, PS-6, SA-5, SA-9, SA-21	
PS-8	1	Personnel Security Personnel Sanctions	a. Employ a formal sanctions process for individuals failing to comply with established information security and privacy policies and procedures; and b. Notify [Assignment: organization-defined personnel or roles] within [Assignment: organization-defined time-period] when a formal employee sanctions process is initiated, identifying the individual sanctioned and the reason for the sanction.	Organizational sanctions reflect applicable laws, executive orders, directives, regulations, policies, standards, and guidelines. Sanctions processes are described in access agreements and can be included as part of general personnel policies for organizations and/or specified in security and privacy policies. Organizations consult with the Office of the General Counse regarding matters of employee sanctions.	IR-1, MA-1, MP-1, PE-

					with applicable laws and policies, to implement the principle of minimization.		

		Control Name Withdrawn	Control Text		Related Controls	
PT-S		PII Processing and Transparency Consent	Implement [Assignment: organization-defined tools or mechanisms] for individuals to consent to the processing of their personally identifiable information prior to its collection that: a. Facilitate individuals' informed decision-making; and b. Provide a means for individuals to decline consent.	Consent allows individuals to participate in the decision-making about the processing of their information and transfers some of the risk that arises from the processing of personally identifiable information from the organization to an individual. Organizations consider whether other controls may more effectively mitigate privary risk either alone or inconjunction with consent. Consent may be required by applicable laws, executive orders, directives, regulations, policies, standards, or guidelines. Otherwise, when selecting this control, organizations consider whether individuals can be reasonably expected to understand and accept the privacy risks arising from their authorization. Organizations also consider any demographic or contextual factors that may influence the understanding or obsaivation individuals with respect to the data actions carried out by the system or organization. When soliciting consent from individuals, organizations consider the appropriate mechanism for obtaining consent, individing how to properly authenticate and identity proof individuals and how to obtain consent through electronic means. In addition, organizations consider providing a mechanism for obtaining consent, individuals but nevel excensed none it has been provided, as appropriate. Finally, organizations consider usability factors to help individuals understand the risks being accepted when providing consent, including the use of plain language and avoiding technical jargon.	AC-16, PT-6	
PT-5 (1)		PII Processing and Transparency Consent Tailored Consent	Provide [Assignment: organization-defined mechanisms] to allow individuals to tailor processing permissions to selected elements of personally identifiable information.	service, other processing may not be necessary for the functionality of the product or service. In these circumstances, organizations allow individuals to select how specific personally identifiable information elements may be processed. More tailored consent may help reduce privacy risk, increase individual satisfaction, and avoid adverse behaviors such as abandonment of the product or service.	PT-2	
PT-5 (2)	2	PII Processing and Transparency Consent Just-in- time Consent	Present [Assignment: organization-defined consent mechanisms] to individuals at a time and location where the Individual provides personally identifiable information or in conjunction with a data action.	Just-in-time consent enables individuals to participate in how their personally identifiable information is being processed at the time when such participation may be most useful to the individual. Individual assumptions about how personally identifiable information will be processed might not be accurate or reliable if time has passed since the individual lost gave consent or the particular circumstances under which consent was given have changed. Organizations use discretion to determine when to use just-in-time consent and may use supporting information and temporaphics, focus groups, or surveys to learn more about individuals' privacy interests and concerns.	PT-2	
PT-6	1	PII Processing and Transparency Privacy Notice	Provide notice to individuals about the processing of personally identifiable information that: a. Is available to individuals upon first interacting with an organization, and subsequently at [Assignment: organization-defined frequency]; b. Is clear and easy-to-understand, expressing information about personally identifiable information processing in plain language; c. Identifies the authority that authorizes the processing of personally identifiable information; d. Identifies the purposes for which personally identifiable information is to be processed; and e. Includes [Assignment: organization-defined information].	Privacy notices help inform individuals about how their personally identifiable information is being processed by the system or organization. Organizations use privacy notices to inform individuals about how, under what authority, and for what purpose their personally identifiable information is processed, as well as other information such as choices individuals might have with respect to that processing and, other parties with whom information is shared. Laws, executive orders, directives, regulations, or policies may require that privacy notices individuals especific elements to be provided in specific formats. Federal agency personnel consult with the senior agency official for privacy and legal counsel regarding when and where to provide privacy noticies, as well as elements to include in privacy notices and or require privacy notices, as well as elements to include in privacy notices do not require privacy notices, as source of the elements to include in privacy notices. Or require privacy notices and as source of the elements to include in privacy notices. Privacy risk associated with the processing of personally identifiable information and may help organizations determine appropriate elements to include in a privacy notice to manage such risks. To help individuals understand how their information is being processed, organizations write materials in plain language and avoid technical jargon.	PT-3, PT-5, PT-8, RA-	
PT-6 (1)	2	PII Processing and Transparency Privacy Notice Just-in-time Notice	Present notice of personally identiflable information processing to individuals at a time and location where the individual provides personally identifiable information or in conjunction with a data action, or [Assignment: organization-defined frequency].	Just-in-time notice enables individuals to be informed of how organizations process their personally identifiable information at a time when such notice may be most useful to the individual. Individual assumption about how personally identifiable information will be processed might not be occurate or reliable if time has possed since the organization lost presented notice or the circumstances under which the individual was lost provided notice have changed. Just-in-time notice can explain data actions that organizations have identified as potentially giving rise to greater privacy risk for individuals. Organizations can use just-in-time notice to update or remind individuals bout specific data actions as they occur or highlight specific changes that occurred since lost presenting notice. Ust-in-time notice can be used in conjunction with just-in-time cansent to explain what will occur if consent is declined. Organizations use discretion to determine when to use just-in-time notice and may use supporting information on user demographics, focus groups, or surveys to learn about users' privacy interests and concerns.	PM-21	
PT-6 (2)	2	PII Processing and Transparency Privocy Notice Privocy Act Statements	Include Privacy Act statements on forms that collect information that will be maintained in a Privacy Act system of records, or provide Privacy Act statements on separate forms that can be retained by individuals.	If a federal agency asks individuals to supply information that will become part of a system of records, the agency is required to provide a [PRIVACT] statement on the form used to collect the information or an a separate form that can be retained by the individual. The agency provides a [PRIVACT] statement in such circumstances regardless of whether the information will be collected on a paper or electronic form, on a website, on a mobile application, over the telephone, or through some other medium. This requirement ensures that the individual is provided with sufficient information about the request for information to make an informed decision on whether or not to respond. [PRIVACT] statements provide formal notice to individuals of the authority that authorizes the solicitation of the information, whether providing the information is modatory or voluntary; the principal purpose(s) for which the information is to be used; the published routine uses to which the information is subject; the effects on the individual, if any, of not providing all or any part of the information requested; and an appropriate citation and link to the relevant system of records notice. Federal agency personnel consult with the senior agency official for privacy and legal counsel regarding the notice provisions of the [PRIVACT].	PT-7	

Control ID PT-7	1	Control Name V PII Processing and Transparency System of Records Notice	Control Text For systems that process information that will be maintained in a Privacy Act system of records: a. Draft system of records notices in accordance with OMB guidance and submit new and significantly modificently modificated by the process of the Control of the Con	Oiscussion The [PRIVACT] requires that federal agencies publish a system of records notice in the eff ederal Register upon the establishment and/or modification of a [PRIVACT] system of records. As a general matter, a system of records notice is required when an agency maintains a group of any records under the control of the agency from which information is retrieved by the name of an individual or by some identifying number, symbol, or other identifier. The notice describes the existence and character of the system, and identifies th system of records, the purpose(s) of the system, the authority for maintenance of the records, the categories of records maintained in the system, the categories of individuals about whom records are maintained, the routine uses to which the records are subject, and additional details about the system as described in [OMB A-108].		Notes
PT-7 (1)	2	PII Processing and Transparency System of Records Notice Routine Uses	Review all routine uses published in the system of records notice at [Assignment: organization-defined frequency] to ensure continued accuracy, and to ensure that routine uses continue to be compatible with the purpose for which the information was collected.	A [PRIVACT] routine use is a particular kind of disclosure of a record outside of the federal agency maintaining the system of records. A routine use is an exception to the [PRIVACT] prohibition on the disclosure of a record in a system of records without the prior written consent of the individual to whom the record pertains. To qualify as a routine use, the disclosure must be for a purpose that is composible with the purpose for which the information was originally collected. The [PRIVACT] requires agencies to describe each routine use of the records maintained in the system of records, including the categories of users of the records and the purpose of the use. Agencies may only establish routine uses by explicitly publishing them in the relevant system of records notice.		
PT-7 (2)	2	PII Processing and Transparency System of Records Notice Exemption Rules	Review all Privacy Act exemptions claimed for the system of records at [Assignment: organization-defined frequency] to ensure they remain appropriate and necessary in accordance with law, that they have been promulgated as regulations, and that they are accurately described in the system of records notice.	The [PRIVACT] includes two sets of provisions that allow federal agencies to claim exemptions from certain requirements in the statute. These provisions allow agencies in certain circumstances to promulgate regulations to exempt a system of records from select provisions of the [PRIVACT]. At a minimum, organizations [PRIVACT] exemption regulations include the specific namels of one system(s) of records that will be exempt, the specific provisions of the [PRIVACT] from which the system(s) of records is to be exempted, the reasons for the exemption, and an explanation for why the exemption is both necessary and appropriate.		
PT-8	1	PII Processing and Transparency Specific Categories of Personally Identifiable Information	Apply [Assignment: organization-defined processing conditions] for specific categories of personally identifial information.	ole Organizations apply any conditions or protections that may be necessary for specific categories of personally identifiable information. These conditions may be required by laws executive orders, directives, regulations, policies, standards, or guidelines. The requirements may also come from organizational policies and determinations when an organization has determined that a particular category of personally identifiable information is particularly sensitive or raises particular privacy risks. Organizations consult with the senior agency official for privacy and legal counsel regarding any protections that may be necessary.	PT-2, PT-3	
PT-8 (1)		PII Processing and Transparency Specific Categories of Personally Identifiable Information Social Security Numbers	When a system processes Social Security numbers: (a) Eliminate unnecessary collection, maintenance, and use of Social Security numbers, and explore alternative to their use as a personal identifier; (b) Do not deny any individual any right, benefit, or privilege provided by law because of such individual's refit to discloses his or her Social Security number, and (c) Inform any individual who is asked to disclose his or her Social Security number whether that disclosure is mandatory or voluntary, by what statutary or other authority such number is solicited, and what uses will be made of it.	numbers and other sensitive information, and observe any particular requirements that sopply.		
PT-8 (2)	2	PII Processing and Transparency Specific Categories of Personally Identifiable Information First Amendment Information	Prohibit the processing of information describing how any individual exercises rights guaranteed by the First Amendment unless expressly authorized by statute or by the individual or unless pertinent to and within the scope of an authorized law enforcement activity.	None. Related Controls: The [PRIVACT] limits agencies' oblitly to process information that describes how individuals exercise rights guaranteed by the First Amendment. Organizations consult with the senior agency official for privacy and legal counsel regarding these requirements.		
PT-9		PII Processing and Transparency Computer Matching Requirements	When a system or organization processes information for the purpose of conducting a matching program: a. Obtain approval from the Data Integrity Board to conduct the matching program; b. Develop and enter into a computer matching agreement; c. Publish a matching notice in the Federal Register; d. Independently verify the information produced by the matching program before taking adverse action aga an individual, if required; and e. Provide individuals with notice and an opportunity to contest the findings before taking adverse action aga an individual.	The [PRIVACT] establishes a set of requirements for federal and non-federal agencies when they engage in a matching program. In general, a matching program is a computerized comparison of records from two or more automated [PRIVACT] systems of records, or an automated system of records and automated records maintained by a non-Federal agency (or agent thereof). A matching program either pertains to Federal benefit programs or Federal personnel or payroll records. A Federal benefit match is performed for purposes of	PM-24	
RA	0	Risk Assessment				
RA-1	1	Risk Assessment Policy and Procedures	a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more): organization-level; mission/business process-level; system-level] risk assessment policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entitles, and compliance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the risk assessment policy and the associated risk assessment controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the risk assessment policy and procedures; and c. Review and update the current risk assessment: 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	establishing such policies and procedures. Policies and procedures help provide security an privacy assurance. Therefore, it is important that security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy programs and for

			security categorization decision.	availability. Security categorization is also a type of asset loss characterization in systems	12	
			security categorization decision.	security engineering processes carried out throughout the system development life cycle.	12	
				Organizations can use privacy risk assessments or privacy impact assessments to better		
				understand the potential adverse effects on individuals.		
				Organizations conduct the security categorization process as an organization-wide activity		
				with the direct involvement of chief information officers, senior agency information security		
				officers, senior agency officials for privacy, system owners, mission and business owners,		
				and information owners or stewards. Organizations consider the potential adverse impacts		
				to other organizations and, in accordance with [USA PATRIOT] and Homeland Security		
				Presidential Directives, potential national-level adverse impacts.		
				Security categorization processes facilitate the development of inventories of information		
				assets, and along with CM-8, mappings to specific system components where information is		
				processed, stored, or transmitted. The security categorization process is revisited		
				throughout the system development life cycle to ensure the security categories remain		
				accurate and relevant.		
RA-2 (1)	2	Risk Assessment Security Categorization Impact-	Conduct an impact-level prioritization of organizational systems to obtain additional granularity on system	Organizations apply the "high water mark" concept to each system categorized in		
' '		level Prioritization	impact levels.	accordance with [FIPS 199] resulting in systems designated as low impact, moderate		
				impact, or high impact. Organizations desiring additional granularity in the system impact		
				designations for risk-based decision making, can further partition the systems into sub-		
				categories of the initial system categorization. For example, an impact-level prioritization on		
				a moderate-impact system can produce three new sub-categories: low-moderate systems,		
				moderate-moderate systems, and high-moderate systems. Impact-level prioritization and		
				the resulting sub-categories of the system give organizations an opportunity to focus their		
				investments related to security control selection and the tailoring of control baselines in		
				responding to identified risks. Impact-level prioritization can also be used to determine		
				those systems that may be of heightened interest or value to adversaries or represent a		
				critical loss to the federal enterprise, sometimes described as high value assets. For such		
				high value assets, organizations may be more focused on complexity, aggregation, and		
				interconnections. Systems with high value assets can be prioritized by partitioning high-		
				impact systems into low-high systems, moderate-high systems, and high-high systems.		
RA-3	1	Risk Assessment Risk Assessment	a. Conduct a risk assessment, including:	Clearly defined authorization boundaries are a prerequisite for effective risk assessments.	CA-3, CM-4, CM-13,	
1			1. The likelihood and magnitude of harm from unauthorized access, use, disclosure, disruption, modification, or	Risk assessments consider threats, vulnerabilities, likelihood, and impact to organizational	CP-6, CP-7, IA-8, MA-

Discussion. The reporting channel is publicly discoverable and contains clear language authorizing good-faith research and disclosure of vulnerabilities to the organization. The organization does not condition its authorization on an expectation of indefinite non-disclosure to the public by the reporting entity, but may request a specific time period to properly remediate the vulnerability.	neated controls	
RA-6	1	Risk Assessment Technical Surveillance Countermeasures Survey		Employ a technical surveillance countermeasures survey at [Assignment: organization-defined locations] [Selection (one ormore): [Assignment: organization-defined frequency]; [Assignment: organization-defined events or indicators occur]].	A technical surveillance countermeasures survey is a service provided by qualified personnel to detect the presence of technical surveillance devices and hazards and to identify technical security weaknesses that could be used in the conduct of a technical penetration of the surveyed facility. Technical surveillance countermeasures surveys also provide evaluations of the technical security posture of organizations and facilities and include visual, electronic, and physical examinations of surveyed facilities, internally and externally. The surveys also provide useful input for six assessments and information regarding organizational exposure to potential adversaries.		
RA-7	1	Risk Assessment Risk Response		Respond to findings from security and privacy assessments, monitoring, and audits in accordance with organizational risk tolerance.	Organizations have many options for responding to risk including mitigating risk by implementing new controls or strengthening existing controls; accepting risk with appropriate justification or rationale; sharing or transferring risk; or avoiding risk. The risk tolerance of the organization influences risk response decisions and actions. Risk response addresses the need to determine an appropriate response to risk before generating a plan of action and milestones entry. For example, the response may be to accept risk or reject risk, or it may be possible to miligiate the risk immediately so a plan of action and milestones entry is not needed. However, if the risk response is to mitigate the risk and the mitigation cannot be completed immediately, a plan of action and milestones entry is generated.	CA-5, IR-9, PM-4, PM 28, RA-2, RA-3, SR-2	
RA-S	1	Risk Assessment Privacy Impact Assessments		Conduct privacy impact assessments for systems, programs, or other activities before: a. Developing or procuring information technology that processes personally identifiable information; and b. Initiating a new Collection of personally identifiable information that: 1. Will be processed using information technology; and 2. Includes personally identifiable information permitting the physical or online contacting of a specific individual, if identical questions have been posed to, or identical reporting requirements imposed on, ten or more persons, other than agencies, instrumentalities, or employees of the federal government.	handled to ensure that handling conforms to applicable privacy requirements, determine	CM-13, PT-2, PT-3, PT 6, RA-1, RA-2, RA-3, RA-7	
RA-9	1	Risk Assessment Criticality Analysis		Identify critical system components and functions by performing a criticality analysis for [Assignment: organization-defined systems, system components, or system services] at [Assignment: organization-defined decision points in the system development life cycle].	Criticality analysis is a key tenet of, for example, supply chain risk management, and informs the	(P-2, PL-2, PL-8, PL-11, PM-1, RA-2, SA-8, SA-15, SA-20	
RA-10		Risk Assessment Threat Hunting		a. Establish and maintain a cyber threat hunting capability to: 1. Search for indicators of compromise in organizational systems; and 2. Detect, track, and disrupt threats that evade existing controls; and b. Employ the threat hunting capability [Assignment: organization-defined frequency].	Threat hunting is an active means of cyber defense in contrast to the traditional protection measures such as firewalls, intrusion detection and prevention systems, quarantining malicious code in sandboxes, and Security information and Event Management technologies and systems. Cyber threat hunting involves proactively searching organizational systems, networks, and infrastructure for advanced threats. The objective is to track and disrupt cyber adversaries as early as possible in the attack sequence and to measurably improve the speed and accuracy of organizational responses. Indications of compromise include unsusual network traffic, unusual file changes, and the presence of malicious code. Threat hunting teams leverage existing threat intelligence and may create new threat intelligence, which is shared with peer organizations, flormation Sharing and Analysis Organizations (ISAO), information Sharing and Analysis Centers (ISAC), and relevant government departments and agencies. SA	0	System and Services Acquisition					

Control ID	Level	Control Name	Withdrawn	Control Text	Discussion	Related Controls Notes	
5A-1	1	System and Services Acquisition Policy and Procedures		a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more]: organization-level; mission/business process-level; system-level] system and services acquisition policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entitles, and compliance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the system and services acquisition policy and the associated system and services acquisition controls; b. Designate and Rissignment: organization-defined official] to manage the development, documentation, and dissemination of the system and services acquisition policy and procedures; and c. Review and update the current system and services acquisition: 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the SA Family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and privacy assurance. Therefore, it is important that security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy programs and for systems, if needed. Procedures describe how the policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.	PM-9, PS-8, SA-8, SI- 12	
SA-2	1	System and Services Acquisition Allocation of Resources		a. Determine the high-level information security and privacy requirements for the system or system service in mission and business process planning; b. Determine, document, and allocate the resources required to protect the system or system service as part of the organizational capital planning and investment control process; and c. Establish a discrete line item for information security and privacy in organizational programming and budgeting documentation.		PL-7, PM-3, PM-11, SA-9, SR-3, SR-5	
SA-3	1	System and Services Acquisition System Development Life Cycle		a. Acquire, develop, and manage the system using [Assignment: organization-defined system development life cycled that incorporates information security and privacy considerations; b. Define and document information security and privacy roles and responsibilities throughout the system development life cycle; c. Identify individuals having information security and privacy roles and responsibilities; and d. Integrate the organizational information security and privacy risk management process into system development life cycle activities.	A system development life cycle process provides the foundation for the successful development, implementation, and operation of organizational systems. The integration of security and privacy considerations early in the system development life cycle is a foundational principle of systems security engineering and privacy engineering. To apply the required controls within the system development life cycle requires a basic understanding of information security and privacy, threats, vulnerabilities, adverse impacts, and risk to critical missions and business functions. The security engineering principles in SA-8 help individuals properly design, code, and test systems and system components. Organizations include in system development life cycle processes, qualified personnel, including seinor agency information security officers, senior agency officials for privacy, security and privacy requirements are incorporated into organizational systems. Role-based security and privacy requirements are incorporated into organizational systems. Role-based security and privacy requirements are incorporated into organizational systems. Role-based security and privacy requirements into enterprise architecture also helps to ensure that important security and privacy requirements into enterprise architecture also helps to ensure that important security and privacy considerations are addressed throughout the system life cycle and that those condictations are indictly related to organizational missions that business processes. This process also facilitates the integration of the information security and privacy requirements into enterprise architecture also helps to ensure that important security and privacy considerations are addressed throughout the system life cycle and that those condictations are relately related to organizational missions and business processes. This process also facilitates the integration of the information security and privacy considerations are considerated with smanagement strategy of the organization. SA-3 (1)	2	System and Services Acquisition System Development Life Cycle Manage Preproduction Environment		Protect system preproduction environments commensurate with risk throughout the system development life cycle for the system, system component, or system service.		CM-2, CM-4, RA-3, RA-9, SA-4	
SA-3 (2)	2	System and Services Acquisition System Development Life Cycle Use of Live or Operational Data		(a) Approve, document, and control the use of live data in preproduction environments for the system, system component, or system service; and (b) Protect preproduction environments for the system, system component, or system service at the same impact or classification level as any live data in use within the preproduction environments.	Live data is also referred to as operational data. The use of live or operational data in preproduction (i.e., development, test, and integration) environments can result in significant risk to organizations. In addition, the use of personally identifiable information in testing, research, and training increases risk of unauthorized disclosure or misuse of such information. Thus, it is important for the organization to manage any additional risks that may result from use of live or operational data. Organizations can minimize such risk by using test or dummy data during the design, development, and testing of systems, system components, and system services. Risk assessment techniques may be used to determine if the risk of using live or operational data is acceptable.	PM-25, R4-3	
SA-3 (3)	2	System and Services Acquisition System Development Life Cycle Technology Refresh		Plan for and implement a technology refresh schedule for the system throughout the system development life cycle.	Technology refresh planning may encompass hardware, software, firmware, processes, personnel skill sets, suppliers, service providers, and facilities. The use of obsolete or nearing obsolete technology may increase security and privacy risks associated with, for example, unsupported components, components unable to implement security or privacy requirements, counterfeit or re-purposed components, slow or inaperable components, components from untrusted sources, inadvertent personnel error, or increased complexity. Technology refreshes typically occur during the operations and maintenance stage of the system development life cycle.

SA-4 (9)	2	Control Name System and Services Acquisition Acquisition Process Functions, Ports, Protocols, and Services in Use	withdrawn	Control Text Require the developer of the system, system component, or system service to identify the functions, ports, protocols, and services intended for organizational use.	Discussion The identification of functions, ports, protocols, and services early in the system development life cycle, for example, during the initial requirements definition and design stages, allows organizations to influence the design of the system, system component, or system service. This early involvement in the system life cycle helps organizations to avoid or minimize the use of functions, ports, protocols, or services that pose unnecessarily high six and understand the trade-offs involved in blocking specific ports, protocols, or services or when requiring system service providers to do so. Eurly identification of functions, ports, protocols, and services avoids costly retrofitting of cantods after the system, component, or system service has been implemented. SA-9 describes the requirements for external system services. Organizations identify which functions, ports, protocols, and services are provided from external sources.	Related Controls CM-7, SA-9	Notes
SA-4 (10)	2	System and Services Acquisition Acquisition Process Use of Approved PIV Products		Employ only information technology products on the FIPS 201-approved products list for Personal Identity Verification (PIV) copability implemented within organizational systems.	Products on the FIPS 201-approved products list meet NIST requirements for Personal Identity Verification (PIV) of Federal Employees and Contractors. PIV cards are used for multifactor authentication in systems and organizations.	IA-2, IA-8, PM-9	
SA-4 (11)	2	System and Services Acquisition Acquisition Process System of Records		include [Assignment: organization-defined Privacy Act requirements] in the acquisition contract for the operation of a system of records on behalf of an organization to accomplish an organizational mission or function.	When an organization provides by a contract for the operation of a system of records to accomplish an organizational mission or function, the organization, consistent with its authority, causes the requirements of the [PRIVACT] to be applied to the system of records.	PT-7	
SA-4 (12)		System and Services Acquisition Acquisition Process Data Ownership		(a) Include organizational data ownership requirements in the acquisition contract; and (b) Require all data to be removed from the contractor's system and returned to the organization within [Assignment: organization-defined timeframe].	Contractors operating a system that contains data owned by an organization initiating the contract, have policies and procedures in place to remove the data from their systems and/or return the data in a timeframe defined by the contract.		
SA-5	1	System and Services Acquisition System Documentation		a. Obtain administrator documentation for the system, system component, or system service that describes: 1. Secure configuration, installation, and operation of the system, component, or service; 2. Effective use and maintenance of security and privacy functions and mechanisms; and 3. Known vulnerabilities regarding configuration and use of administrative or privileged functions; b. Obtain user documentation for the system, system component, or system service that describes: 1. User-accessible security and privacy functions and mechanisms and how to effectively use those functions an mechanisms; 2. Methods for user interaction, which enables individuals to use the system, component, or service in a more secure manner and protect individual privacy; and 3. User responsibilities in maintaining the security of the system, component, or service and privacy of individuals; c. Document attempts to obtain system, system component, or system service documentation when such documentation is either unavailable or nonexistent and takes [Assignment: organization-defined actions] in response; d. Protect documentation as required, in accordance with the organizational risk management strategy; and e. Distribute documentation to [Assignment: organization-defined personnel or roles].	functions. Control ID	Lovel	Control Name	Control Tout	Discussion	Related Controls	Notes
SA-8 (1)	2	Control Name Withdrawn System and Services Acquisition Security and Privacy Engineering Principles Clear Abstractions	Control Text Implement the security design principle of clear obstractions.	Discussion The principle of clear abstractions states that a system has simple, well-defined interfaces and functions that provide a consistent and intuitive view of the data and how it is managed. The elegance (e.g., clority, simplicity, necessity, and sufficiency) of the system interfaces, combined with a precise definition of their functional behavior promotes ease. The analysis, inspection, and testing as well as the correct and secure use of the system. The clarity of an abstraction is subjective. Examples reflecting application of this principle include avoidance of redundant, unused interfaces; information hiding; and avoidance of semantic overloading of interfaces or their parameters (e.g., not using a single function to provide different functionality, depending on how it is used), information hiding, also known as representation-independent programming, a design affection to incompose the control of information in one system component is not visible to another system component invoking or calling the first component, such that the published abstraction is not influenced by how the data may be managed internally.	Related Controls	Notes
SA-8 (2)	2	System and Services Acquisition Security and Privacy Engineering Principles Least Common Mechanism	Implement the security design principle of least common mechanism in [Assignment: organization-defined systems or system components].	The principle of least common mechanism states that the amount of mechanism common to more than one user and depended on by all users is minimized [POPEK74]. Minimization of mechanism implies that different components of a system refrain from using the same mechanism to access a system resource. Every shared mechanism leapeadily or mechanism involving shared variables) represents a potential information path between users and is designed with prear care to be sure it does not unimitentionally compromise security [SAILTER75]. Implementing the principle of least common mechanism helps to reduce the adverse consequences of sharing system state among different programs. A single program corrupting a shared state (including shared variables) has the potential to corrupt other programs that are dependent on the state. The principle of least common mechanism also supports the principle of simplicity of design and addresses the issue of covert storage channels [LAMPSON73].		
SA-8 (3)	2	System and Services Acquisition Security and Privacy Engineering Principles Modularity and Layering	Implement the security design principles of modularity and loyering in [Assignment: organization-defined systems or system components].	The principles of modularity and layering are fundamental across system engineering disciplines. Modularity and layering derived from functional decomposition are effective in managing system complexity, by making it possible to comprehend the structure of the system. Modular decomposition, or refinement in system design, is challenging and resists general statements of principle. Modularity serves to isolate functions and related data structures into well-defined logical units. Layering allows the relationships of these units to be better understood, so that dependencies are clear and undesired complexity can be avoided. The security design principle of modularity extends functional modularity to include considerations based on trust, trustworthiness, privilege, and security policy, Security-informed modular decomposition includes the following: allocation of policies to systems in a network; separation of system applications into processes with distinct address spaces; allocation of system policies to layers; and separation of processes into subjects with distinct privileges based on hardware-supported privilege domains.	sc-2, sc-3	
SA-8 (4)	2	System and Services Acquisition Security and Privacy Engineering Principles Partially Ordered Dependencies	Implement the security design principle of partially ordered dependencies in [Assignment: organization-defined systems or system components].	The principle of partially ordered dependencies states that the synchronization, calling, and other dependencies in the system are partially ordered. A fundamental cancept in system design is loyering, whereby the system is arganized into well-defined, functionally related modules or components. The layers are linearly ordered with respect to inter-layer dependencies, such that higher layers are dependent on lower layers. While providing functionality to higher layers, some layers can be self-contained and not dependent upon lower layers. While a partial ordering of all functions in a given system may not be possible, if circular dependencies are constrained to occur within layers, the inherent problems of includinty can be more easily managed. Partially addresd dependencies and system layering contribute significantly to the simplicity and the coherency of the system design. Partially ordered dependencies also facilitate system testing and analysis.		
SA-8 (5)	2	System and Services Acquisition Security and Privacy Engineering Principles Efficiently Mediated Access	Implement the security design principle of efficiently mediated access in [Assignment: organization-defined systems or system components].	The principle of efficiently mediated access states that policy-enforcement mechanisms utilize the least common mechanism available while satisfying stakeholder requirements within expressed constraints. The mediation of access to system resources (i.e., CPU, memory, devices, communication ports, services, infrastructure, data and information is often the predominant security function of secure systems. It also enables the realization of pratections for the capability provided to stakeholders by the system. Mediation of resource access can result in performance bottlenecks if the system is not designed correctly. For example, by using hardware mechanisms, efficiently mediated access can be achieved. Once access to a low-level resource such as memory has been obtained, hardware protection mechanisms can ensure that out-of-bounds access does not occur.		
SA-8 (6)	2	System and Services Acquisition Security and Privacy Engineering Principles Minimized Sharing	Implement the security design principle of minimized sharing in [Assignment: organization-defined systems or system components].	The principle of minimized sharing states that no computer resource is shared between system components (e.g., subjects, processes, functions) unless it is obsolutely necessary to do so. Minimized sharing helps to simplify system design and implementation. In order to protect user-domain resources from arbitrary active entitles, no resource is shared unless that sharing has been explicitly requested and granted. The need for resource sharing can be motivated by the design principle of least common mechanism in the case internal entities, or driven by stakeholder requirements. However, internal sharing is carefully designed to avoid performance and covert storage- and timing-channel problems. Sharing via common mechanism can increase the susceptibility of data and information to unauthorized access, disclosure, use, or modification and can adversely affect the inherent capability provided by the system. To minimize sharing induced by common mechanisms can be designed to be reentant or virtualized to preserve separation. Moreover, use of global data to share information is carefully scrutinized. The lack of encapsulation may obfuscate relationships among the sharing entities.	SC-31	

	Level			Discussion	Related Controls	Notes
Control ID SA-8 (7)	2	Control Name System and Services Acquisition Security and Privacy Engineering Principles Reduced Complexity	Control Text Implement the security design principle of reduced complexity in [Assignment: organization-defined systems or system components].	Discussion The principle of reduced complexity states that the system design is as simple and small as possible. A small and simple design is more understandable, more analyzable, and less prone to error. The reduced complexity principle applies to any aspect of a system, but it has particular improtance for security due to the various analyzes performed to obtain evidence about the emergent security are to the various analyzes performed to obtain evidence about the emergent security property of the system. For such analyses to be successful, a small and simple design is essential. Application of the principle of reduced complexity contributes to the ability of system developers to understand the correctness and completeness of system security functions. It also facilitates identification of potential vulnerabilities. The corollary of reduced complexity states that the simplicity of the system is directly related to the number of vulnerabilities it will contain — that is, simpler systems in directly related to the number of vulnerabilities in the intended security policy has been captured in the system design, and that fewer vulnerabilities in elikely to be introduced during engineering development. An additional benefit is that any such conclusion about correctness, completeness, and existence of vulnerabilities can be reached with a higher degree of assurance in contrast to conclusions reached in situations where the system design is inherently more complex. Transitioning from idea technologies to newer technologies (e.g., transitioning from livel to INFO) may require implementing the older and newer technologies in system complexity during the transition period. This may result in a temporary increase in system complexity during the transition.	Related Controls	Notes
SA-8 (8)		System and Services Acquisition Security and Privacy Engineering Principles Secure Evolvability	Implement the security design principle of secure evolvability in [Assignment: organization-defined systems or system components].	The principle of secure evolvability states that a system is developed to facilitate the maintenance of its security properties when there are changes to the system's structure, interfaces, interconnections (i.e., security projecties when there are changes to the system's structure, interfaces, interconnections (i.e., security policy enforcement). Changes include a new, an enhanced, or an upgraded system capability: maintenance and sustainment activities; and reconfiguration. Although it is not possible to plan for every aspect of system evolution, system upgrades and changes are be anticipated by analyses of mission or business strategic direction; anticipated changes in the threat environment; and anticipated maintenance and sustainment needs. It is unrealistic to expect that complex systems remain secure in contexts not envisioned during development, whether such ontexts are related to the operational environment or to usage. A system may be secure in some new contexts, but there is no guarantee that its emergent behavior will always be secure. It is easier to build trastvorthiness into a system from the outset, and it follows that the sustainment of system trustworthiness requires planning for change as apposed to adapting in an od hoc or non-methodical manner. The benefits of this principle include reduced vendor life-cycle costs; reduced cost of ownership; improved system security; more effective management of security risk; and less risk uncertainly.	CM-3	
SA-8 (2)	2	System and Services Acquisition Security and Privacy Engineering Principles Trusted Components	Implement the security design principle of trusted components in [Assignment: organization-defined systems or system components].	The principle of trusted components states that a component is trustworthy to at least a level commensurate with the security dependencies is supports (i.e., how much it is trusted to perform its security functions by other components). This principle enables the composition of components such that trustworthiness is not inadvertently diminished and where consequently the trust is not misplaced. Ultimately this principle demands some metric by which the trust in a component and the trustworthiness of a component can be measured on the same abstract scale. The principle of trusted components is particularly relevant when considering systems and components in which there are complex chains of trust dependencies. A trust dependency is also referred to as a trust relationship and there may be chains of trust relationships. The principle of trusted components also applies to a compound component that consists of subcomponents (e.g., a subsystem), which may have varying levels of trustworthiness. The conservative assumption is that the trustworthiness of a compound component is that of its least trustworthy subcomponent. It may be possible to provide a security engineering rationale that the trustworthiness of a compound component is greater than the conservative assumption; however, any such rationale reflects logical reasoning based on a clear statement of the trustworthiness objectives, and relevant and credible evidence. The trustworthiness of a compound components beforese-in-depth techniques do not increase the trustworthiness of the whole above that of the least trustworthy component.		
SA-8 (20)	2	System and Services Acquisition Security and Privacy Engineering Principles Hierarchical Trust	Implement the security design principle of hierarchical trust in [Assignment: organization-defined systems or system components].	The principle of hierarchical trust for components builds on the principle of trusted components and states that the security dependencies in a system will form a partial ordering if they preserve the principle of trusted components. The analysis of the basis for trustworthiness reasoning or providing an assurance case or argument when composing a secure system from heterogeneously trustworthy components. To analyse a system composing a secure system heterogeneously trustworthy components. To analyse a system composed of heterogeneously trustworthy components for its trustworthiness, it is essential to eliminate circular dependencies with regard to the trustworthiness. If a more trustworthy component located an lower layer of the system were to depend upon a less trustworthy component in a higher loyer, this would in effect, put the components in the same "less trustworthy" equivalence class per the principle of trusted components. Trust relationships, or chains of trust, can have various manifestations. For example, the root certificate of eartificate hierarchy is the most trusted node in the hierarchy, whereas the leeves in the hierarchy may be the least trustworthy nodes. Another example occurs in a layered high-assurance system where the security kernel (including the hardware base), which is located at the lowest layer of the system, is the most trustworthy component. The principle of hierarchical trust, however, does not prohibit the use of overly trustworthy component. The principle of hierarchical trust, however, does not prohibit the use of overly trustworthy (e.g., components. There may be cases in a system of low trustworthiness, where it is reasonable to employ a highly trustworthy component rather than one that is less trustworthy (e.g., due to availability or other cost-benefit drivee). For such a case, any dependency of the highly trustworthy component upon a less trustworthy component does not degrade the trustworthiness of the resulting low-trust system.		

Control ID	Louis	Control Name Withdrawn	Control Text	Plantalan	lated Controls	Neve
SA-8 (11)	2	Control Name Withdrawn System and Services Acquisition Security and Privocy Engineering Principles Inverse Modification Threshold	Control Text Implement the security design principle of inverse modification threshold in [Assignment: organization-defined systems or system components].	The principle of inverse modification threshold builds on the principle of trusted components and the principle of hierarchical trust, and states that the degree of protection provided to a component is commensurate with its trustworthiness. As the trust placed in a component increases, the protection against unauthorized modification of the component olso increases to the same degree. Protection from unauthorized modification can come in the form of the component's own self-protection and innate trustworthiness, or it can come from the protections of finate trustworthiness, or it can come from the protections of forded to the component from other elements or attributes of the security architecture (to include protections in the environment of operation).	lated Controls	Notes
SA-8 (12)	2	System and Services Acquisition Security and Privacy Engineering Principles Hierarchical Protection	Implement the security design principle of hierarchical protection in [Assignment: organization-defined systems or system components].	The principle of hierarchical protection states that a component need not be protected from more trustworthy components. In the degenerate case of the most trusted component, it protects itself from all other components. For example, if an operating system kernel is deemed the most trustworthy component in a system, then it protects itself from all untrusted applications it supports, but the applications, conversely, do not need to protect themselves from the kernel. The trustworthiness of users is a consideration for applying the principle of hierarchical protection. A trusted system need not protect their flow an equally trustworthy user, reflecting use of untrusted systems in "system high" environments where users are highly trustworthy and where other protections are put in place to bound and protect the "system high" execution environment.		
SA-8 (13)	2	System and Services Acquisition Security and Privacy Engineering Principles Minimized Security Elements	Implement the security design principle of minimized security elements in [Assignment: organization-defined systems or system components].	The principle of minimized security elements states that the system does not have extraneous trusted components. The principle of minimized security elements has two aspects: the overall cost of security analysis and the complexity of security analysis. Trusted components are generally costiler to construct and implement, owing to increased rigor of development processes. Trusted components also require greater security analysis to qualify their trustworthiness. Thus, to reduce the cost and decrease the complexity of the security analysis, a system contains as few trustworthy components as possible. The analysis of the interaction of trusted components with other components of the system is one of the most important aspects of system security verification. If the interactions between components are unnecessarily complex, the security of the system will also be more difficult to ascertain than one whose internal trust relationships are simple and elegantly constructed. In general, fewer trusted components result in fewer internal trust relationships and a simpler system.		
SA-8 (14)	2	System and Services Acquisition Security and Privacy Engineering Principles Least Privilege	Implement the security design principle of least privilege in [Assignment: organization-defined systems or system components].	The principle of least privilege states that each system component is allocated sufficient privileges to accomplish its specified functions, but no more. Applying the principle of least privilege limits the scope of the component's actions, which has two desirable effects: the security impact of a failure, corruption, or misuse of the component will have a minimized security impact of a failure, corruption, or misuse of the component will be simplified. Least privilege is a pervasive principle that is reflected in all aspects of the secure system design. Interfaces used to invoke component capability or available to only certain subsets of the user population, and component design supports a sufficiently fine granularity of privilege decomposition. For example, in the case of an audit mechanism, there may be an interface for the audit amonger, who configures the audit settings; an interface for the audit operator, who ensures that outlit data is safely collected and stored; and, finally, yet another interface for the audit reviewer, who has need only to view the audit data that has been collected but no need to perform operations on that data. In addition to its samplestations at the system interface, least privilege can be used as a quiding principle for the internal structure of the system itself, One espect of internal least privilege is to construct modules so peration are indivestive accessed through internation that may be effected by the module's operation is individual construction and other or individual construction of the system internal least privilege is that the scope of a given module or component includes only those system elements that are necessary for its functionality, and that the access modes for the elements (e.g., read, write) ore minimal.	-6, CM-7	
SA-8 (15)	2	System and Services Acquisition Security and Privacy Engineering Principles Predicate Permission	Implement the security design principle of predicate permission in [Assignment: organization-defined systems or system components].	The principle of predicate permission states that system designers consider requiring multiple authorized entities to provide consent before a highly critical aperation or access to highly sensitive data, information, or resources to allowed to proceed. FAITERTS] originally named predicate permission the separation of privilege. It is also equivalent to separation of duty. The division of privilege among multiple parties decreases the likelihood of abuse and provides the safeguard that no single accident, deception, or breach of trust is sufficient to enable an unrecoverable action that can lead to significantly damaging effects. The design potions for such a mechanism may require simultaneous action (e.g., the firing of a nuclear weapon requires two different authorized individuals to give the correct command within a small time window) or a sequence of operations where each successive action is enabled by some prior action, but no single individual is able to enable more than one action.	-·s	
SA-8 (16)	2	System and Services Acquisition Security and Privacy Engineering Principles Self-reliant Trustworthiness	Implement the security design principle of self-reliant trustworthiness in [Assignment: organization-defined systems or system components].	The principle of self-reliant trustworthiness states that systems minimize their reliance on other systems for their own trustworthiness. A system is trustworthy by default with any connection to an external entity used to supplement its function. If a system were required to maintain a connection with another external entity in order to maintain its unstain. If a system were required to maintain is set, then that system would be vulnerable to malicious and non-malicious threats that result in loss or degradation of that connection. The benefit to the principle of self-reliant trustworthiness is that the isolation of a system will make it less vulnerable to additionally to this principle relates to the ability of the system (or system component) to operate in isolation and then resynchronize with other components when it is rejoined with them.

SA-8 (17)	2		Implement the security design principle of secure distributed composition in [Assignment: organization-defined	The principle of secure distributed composition states that the composition of distributed		
		Engineering Principles Secure Distributed	systems or system components].	components that enforce the same system security policy result in a system that enforces		
		Composition		that policy at least as well as the individual components do. Many of the design principles		
				for secure systems deal with how components can or should interact. The need to create or		
				enable capability from the composition of distributed components can magnify the		
				relevancy of these principles. In particular, the translation of security policy from a stand-		
				alone to a distributed system or a system-of-systems can have unexpected or emergent		
				results. Communication protocols and distributed data consistency mechanisms help to		
				ensure consistent policy enforcement across a distributed system. To ensure a system-wide		
				level of assurance of correct policy enforcement, the security architecture of a distributed		
				composite system is thoroughly analyzed.		
SA-8 (18)	2	System and Services Acquisition Security and Privacy	Implement the security design principle of trusted communications channels in [Assignment: organization-	The principle of trusted communication channels states that when composing a system	SC-8, SC-12, SC-13	
		Engineering Principles Trusted Communications	defined systems or system components].	where there is a potential threat to communications between components (i.e., the		
		Channels		interconnections between components), each communication channel is trustworthy to a		
				level commensurate with the security dependencies it supports (i.e., how much it is trusted		
				by other components to perform its security functions). Trusted communication channels		
				are achieved by a combination of restricting access to the communication channel (to		
				ensure an acceptable match in the trustworthiness of the endpoints involved in the		
				communication) and employing end-to-end protections for the data transmitted over the		
				communication channel (to protect against interception, modification, and to further		
				increase the assurance of proper end-to-end communication).		
SA-8 (19)		System and Services Acquisition Security and Privacy	Implement the security design principle of continuous protection in [Assignment: organization-defined systems	The principle of continuous protection states that components and data used to enforce the	AC-25	
		Engineering Principles Continuous Protection	or system components].	security policy have uninterrupted protection that is consistent with the security policy and		
				the security architecture assumptions. No assurances that the system can provide the		
				confidentiality, integrity, availability, and privacy protections for its design capability can be		
				made if there are gaps in the protection. Any assurances about the ability to secure a		
				delivered capability require that data and information are continuously protected. That is,		
				there are no periods during which data and information are left unprotected while under		
				control of the system (i.e., during the creation, storage, processing, or communication of the		
				data and information, as well as during system initialization, execution, failure,		
				interruption, and shutdown). Continuous protection requires adherence to the precepts of		
				the reference monitor concept (i.e., every request is validated by the reference monitor, the		
				reference monitor is able to protect itself from tampering, and sufficient assurance of the		
				correctness and completeness of the mechanism can be ascertained from analysis and		
				testing), and the principle of secure failure and recovery (i.e., preservation of a secure state		
				during error, fault, failure, and successful attack; preservation of a secure state during		
				recovery to normal, degraded, or alternative operational modes).		
				Continuous protection also applies to systems designed to operate in varying		
				configurations, including those that deliver full operational capability and degraded-mode		
				configurations that deliver partial operational capability. The continuous protection		
				principle requires that changes to the system security policies be traceable to the		
				operational need that drives the configuration and be verifiable (i.e., it is possible to verify		
				that the proposed changes will not put the system into an insecure state). Insufficient		
				traceability and verification may lead to inconsistent states or protection discontinuities due		
				to the complex or undecidable nature of the problem. The use of pre-verified configuration		
				definitions that reflect the new security policy enables analysis to determine that a		
				transition from old to new policies is essentially atomic, and that any residual effects from		
				the old policy are guaranteed to not conflict with the new policy. The ability to demonstrate		
SA-8 (20)	2	System and Services Acquisition Security and Privacy	Implement the security design principle of secure metadata management in [Assignment: organization-defined	The principle of secure metadata management states that metadata are "first class"		
		Engineering Principles Secure Metadata	systems or system components].	objects with respect to security policy when the policy requires complete protection of		
		Management		information or it requires that the security subsystem to be self-protecting. The principle of		
		-		secure metadata management is driven by the recognition that a system, subsystem, or		
				component cannot achieve self-protection unless it protects the data it relies upon for		
				correct execution. Data is generally not interpreted by the system that stores it. It may have		
				semantic value (i.e., it comprises information) to users and programs that process the data.		
				In contrast, metadata is information about data, such as a file name or the date when the		
				file was created. Metadata is bound to the target data that it describes in a way that the		
				system can interpret, but it need not be stored inside of or proximate to its target data.		
				There may be metadata whose target is itself metadata (e.g., the sensitivity level of a file		
				name), to include self-referential metadata.		
				The apparent secondary nature of metadata can lead to a neglect of its legitimate need for		
				protection, resulting in a violation of the security policy that includes the exfiltration of		
				information. A particular concern associated with insufficient protections for metadata is		
				associated with multilevel secure (MLS) systems. MLS systems mediate access by a subject		
				to an object based on relative sensitivity levels. It follows that all subjects and objects in the		
				scope of control of the MLS system are either directly labeled or indirectly attributed with		
				sensitivity levels. The corollary of labeled metadata for MLS systems states that objects		
				sensitivity levels. The corollary of labeled metadata for MLS systems states that objects containing metadata are labeled. As with protection needs assessment for data, attention

SA-8 (21)	2	System and Services Acquisition Security and Privacy Engineering Principles Self-analysis	Umplement the security design principle of self-analysis in [Assignment: organization-defined systems or system components].	The principle of self-analysis states that a system component is able to assess its internal state and functionality to a limited extent at various stages of execution, and that this self-analysis capability is commensured with the level of trustworthiness invested in the system. At the system level, self-analysis can be achieved through hierarchical assessments of trustworthiness established in a bottom up fashion. In this approach, the lower-level components check for data integrity and correct functionality (to a limited extent) of higher-level components. For example, trusted boot sequences involve a trusted lower-level component attesting to the trustworthiness of the next higher-level component stess to listly involves an axiomatic or environmentally enforced assumption about its integrity. Results of the self-analyses can be used to guard against externally induced errors, or internal malfunction or transient errors. By following this principle, some simple errors or malfunctions can be detected without allowing the effects of the error or malfunction to propagate austice the component. Further, the self-etst can also be used to attest to the configuration of the component, detecting any potential conflicts in configuration with respect to the expected configuration.	C4-7	
SA-8 (22)	2	System and Services Acquisition Security and Privacy Engineering Principles Accountability and Traceability	Implement the security design principle of occountability and traceability in [Assignment: organization-defined systems or system components]. SA-8 (23)	2	System and Services Acquisition Security and Privacy Engineering Principles Secure Defaults	Implement the security design principle of secure defaults in [Assignment: organization-defined systems or system components].	The principle of secure defaults states that the adjoult configuration of a system (in include its constituent subsystems, components, and mechanisms) reflects a restrictive and conservative enforcement of security policy. The principle of secure defaults applies to the initial (i.e., digital) configuration of a system as well as to the security engineering and design of access control and other security functions that follow or "deny unless explicitly authorized" stategy. The initial configuration aspect of this principle requires that any "as shipped" configuration of a system, subsystem, or system component does not aid in the violation of the security policy, and can prevent the system from operating in the default configuration for those cases where the security policy istell requires configuration by the operational unserving policy and early policy and early policy and system. Restrictive defaults mean that the system will operate" as-shipped" with adequate self-protection, and is able to prevent security broaches before the intended security policy and system configuration is established. In cases where the protection provided by the "as-shipped" product is inadequate, stackholders assess the risk of using it princip to establishing ascere infliction. Adherence to the principle of secure defaults guarantees that a system is established in a secure state upon successfully completing initialization. In situations where the system fulls to complete initialization, either it will perform a requested operation using secure defaults or it will not perform the operation. Refer to the inspiriciples of continuous protection and secure finite and recovery that parallel this principle to provide the ability to detect and recovery from failure. The security engineering approach to this principle is to this that security mechanisms dery requests unless the request is found to be well-formed and consistent with the security policy. The inserver performs the operation as feat of the investment will not be precipled t	CM-2, CM-6, SA-4	
SA-8 (24)	2	System and Services Acquisition Security and Privacy Engineering Principles Secure Failure and Recovery	Implement the security design principle of secure failure and recovery in [Assignment: organization-defined systems or system components].	The principle of secure failure and recovery states that neither a failure in a system function or mechanism nor any recovery action in response to failure leads to a volution of security along. The principle of secure failure and recovery panels the entry of the control of the security and the security policies are not voluted. In addition, when specified, the system is capable of recovering from importing or actual failure to remove moral, degraded or entered to select principles and that security policies are not voluted. SA-8 (25)	2	Control Name Withdrawn System and Services Acquisition Security and Privacy Engineering Principles Economic Security	Control Lext. Implement the security design principle of economic security in [Assignment: organization-defined systems or system components].	Discussion. The principle of economic security states that security mechanisms are not costlier than the potential damage that could accur from a security breach. This is the security-relevant form of the cast-benefit analyses used in risk management. The cost assumptions of cost-benefit analysis prevent the system designer from incoporating security mechanisms of greater strength than necessary, where strength of mechanisms is proportional to cost. The principle of economic security also requires analysis of the benefits of assumance relative to the cost of that assurance in terms of the effort expended to obtain relevant and credible evidence, and to perform the analyses necessary to assess and draw trustworthiness and risk conclusions from the evidence.	Related Controls	Notes
\$4-8 (26)	2	System and Services Acquisition Security and Privacy Engineering Principles Performance Security	Implement the security design principle of performance security in [Assignment: organization-defined systems o system components].	The principle of performance security states that security mechanisms are constructed so that they do not degrade system performance unnecessarily. Stokeholder and system design requirements for performance and security are precisely articulated and printitude. For the system implementation to meet its design requirements and be found acceptable to stakeholders (i.e. validation against stakeholders (i.e. validation) are sassessed and demonstrated to pose no significant impact to higher-priority performance considerations or are deemed to be providing an acceptable trade-off of performance for trustworthy protection. The trade-off considerations include less computationally intensive security services is determined by functional capability and strength of mechanism. The strength of mechanism is selected with respect to security requirements as well as performance-critical overhead issues (e.g., cryptographic key management) and an assessment of the coaptive of the threat. The principle of performance security leads to the incorporation of features that help in the enforcement of security policy, but incur minimum overhead, such as low-level hardwore mechanisms upon which higher-level sensies can be built. Such ow-level mechanisms are usually very specific, have very limited functionality, and are optimized for performance. For example, once access rights to a portion of memory is granted, many systems use hardwore mechanisms to ensure that all further accesses involve the correct temory address and access mode. Application of this principle eniforces the need to design security into the system from the ground up, and to incorporate simple mechanisms at the lower layers that c	SC-13, St-2, St-7	
SA-8 (27)	2	System and Services Acquisition Security and Privacy Engineering Principles Human Factored Security	Implement the security design principle of humon factored security in [Assignment: organization-defined systems or system components].	The principle of human factored security states that the user interface for security functions and supporting services is intuitive, user friendly, and provides feedback for user actions that affect such policy and its enforcement. The mechanisms that enforce security policy or not intrusive to the user and are designed not to degrade user efficiency. Security policy renot intrusive to the user and are designed not to degrade user efficiency. Security policy enforcement mechanisms also provide the user with meaningful, clear, and relevant feedback and warnings when insecure choices ore being made. Particular attention is given to interfaces through which personnel responsible for system administration and operation configure and set up the security policies. Ideally, these personnel rea bile to understand the impact of their choices. The personnel with system administrative and operation responsibility or able to configure systems before start-up and administrat them during runtime, in both cases with confidence that their intent is correctly mapped to the system's mechanisms. Security services, functions, and mechanisms do not impade or unnecessarily complicate the intended use of the system. There is a trade-off between system usability and the strictness necessitated for security policy enforcement. If security mechanisms in ways inconsistent with the security requirements and protection needs the mechanisms in ways inconsistent with the security requirements and protection needs the mechanisms were designed to satisfy.		
SA-8 (28)	2	System and Services Acquisition Security and Privacy Engineering Principles Acceptable Security	Implement the security design principle of acceptable security in [Assignment: organization-defined systems or system components].	The principle of acceptable security requires that the level of privacy and performance the system provides is consistent with the users' expectations. The perception of personal privacy may affect user behavior, morale, and effectiveness. Based on the organizational privacy policy and the system design, users should be able to restrict their actions to protect their privacy. When systems fail to provide intuitive interfaces, or meet privacy and performance expectations, users may either choose to completely avoid the system or use it in ways that may be inefficient or even insecure.		
SA-8 (29)	2	System and Services Acquisition Security and Privacy Engineering Principles Repeatable and Documented Procedures	Implement the security design principle of repeatable and documented procedures in [Assignment: organization defined systems or system components].	The principle of repeatable and documented procedures states that the techniques and methods employed to construct a system component permits the same component to be completely and correctly reconstructed at a later time. Repeatable and documented procedures support the development of a component that is identical to the component created earlier that may be in widespread use. In the case of other system artifacts (e.g., documentation and testing results), repeatability supports consistency and ability to inspect the artifacts. Repeatable and documented procedures can be introduced at various stages within the system development life cycle and can contribute to the daility to evaluate assurance claims for the system. Examples include systematic procedures for code development and review; procedures for configuration management of development tools and system artifacts; and procedures for system delivery. Communication		Control Name Withdrawn	Control Text	Planada	Related Controls	Makes
SA-8 (30)	2	System and Services Acquisition Security and Privacy Engineering Principles Pracedural Rigor	Implement the security design principle of procedural rigor in [Assignment: organization-defined systems or system components].	The principle of procedural rigor states that the rigor of a system life cycle process is commensurate with its intended trustworthiness. Procedural rigor defines the scope, depth, and detail of the system life cycle procedures. Rigorous system life cycle procedures contribute to the assurance that the system is correct and free of unintended functionality in several ways. First, the procedures impose checks and bolances on the life cycle process such that the introduction of unspecified functionality is prevented. Second, rigorous procedures applied to systems security engineering activities that produce specifications and other system design documents contribute to the ability to understand the system as it has been built, rather than trusting that the component as implemented, is the authoritative (and potentially misleading) specification. Finally, modifications to an existing system component are easier when there are detailed specifications describing its current design, instead of studying source code or schematics to try to understand how it works. Procedural rigor helps to ensure that security functional and assurance requirements have been satisfied, and it contributes to a better-informed basis for the determination of trustworthiness and risk posture. Procedural rigor is commensurate with the degree of assurance desired for the system. If the required trustworthiness of the system is law, a high level of procedural rigor may add unnecessary cost, whereas when high trustworthiness is critical, the cost of high procedural rigor is merited.		
SA-8 (31)	2	System and Services Acquisition Security and Privacy Engineering Principles Secure System Modification	Implement the security design principle of secure system modification in [Assignment: organization-defined systems or system components].	The principle of secure system modification states that system modification maintains system security with respect to the security requirements and risk tolerance of stakeholders. Upgrades or modifications to systems can transform secure systems that systems that are not secure. The procedures for system modification ensure that, if the system is to maintain its trustworthiness, the same rigor that was applied to its initial development is applied to any system changes. Because modifications can affect the ability of the system to maintain its secure state, a careful security analysis of the modification is needed prior to its implementation and deployment. This principle parallels the principle of secure evolvability.	CM-3, CM-4	
SA-8 (32)	2	System and Services Acquisition Security and Privacy Engineering Principles Sufficient Documentation	implement the security design principle of sufficient documentation in [Assignment: organization-defined systems or system components].	The principle of sufficient documentation states that organizational personnel with responsibility to interact with the system are provided with adequate documentation and other information such that the personnel contribute to rather than detruat from system security. Despite attempts to comply with principles such as human factored security and acceptable security, systems are inherently complex, and the design intent for the use of security mechanisms is not always intuitively obvious. Neither are the ramifications of the insusse or misconfiguration of security mechanisms. Uninformed and insufficiently trained users can introduce vulnerabilities due to errors of omission and commission. The availability of documentation and training can help to ensure a knowledgeable cadre of personnel, all of whom have a critical role in the achievement of principles such as continuous protection. Documentation is written clearly and supported by training that provides security owareness and understanding of security-relevant responsibilities.	AT-2, AT-3, SA-5	
SA-9	1	System and Services Acquisition External System Services	Require that providers of external system services comply with organizational security and privacy requirements and employ the following controls: [Assignment: organization-defined controls]; b. Define and document organizational oversight and user roles and responsibilities with regard to external system services; and c. Employ the following processes, methods, and techniques to monitor control compliance by external service providers on an ongoing basis: [Assignment: organization-defined processes, methods, and techniques].	which the organization has no direct control over the implementation of required controls or the assessment of control effectiveness. Organizations establish relationships with	AC-20, CA-3, CP-2, IR-4, IR-7, PL-10, PL-11, PS-7, SA-2, SA-4, SR-3, SR-5	
SA-9 (1)		System and Services Acquisition External System Services Risk Assessments and Organizational Approvals	(a) Conduct an organizational assessment of risk prior to the acquisition or outsourcing of information security services; and (b) Verify that the acquisition or outsourcing of dedicated information security services is approved by [Assignment: organization-defined personnel or roles].	Information security services include the operation of security devices such as firewalls, or key management services; and incident manitoring, analysis, and response. Risks assessed can include system, mission or business, privacy, or supply chain risks.	CA-6, RA-3	
SA-9 (2)	2	System and Services Acquisition External System Services Identification of Functions, Ports, Protocols, and Services	Require providers of the following external system services to identify the functions, ports, protocols, and other services required for the use of such services: [Assignment: organization-defined external system services].	Information from external service providers regarding the specific functions, ports, protocols, and services used in the provision of such services can be useful when the need arises to understand the trade-offs involved in restricting certain functions and services or blocking certain ports and protocols.	CM-6, CM-7	
SA-9 (3)	2	System and Services Acquisition External System Services Establish and Mointain Trust Relationship with Providers	Establish, document, and maintain trust relationships with external service providers based on the following requirements, properties, factors, or conditions: [Assignment: organization-defined security and privacy requirements, properties, factors, or conditions defining acceptable trust relationships].	The degree of confidence that the risk from using external services is at an acceptable level depends on the trust that organizations place in the external providers, individually or in combination. Trust relationships can help organizations to gain increased levels of confidence that participating service providers are providing adequate protection for the services rendered and can also be useful when conducting incident response or when planning for upgrades or obsolescence. Trust relationships can be complicated due to the potentially large number of entities participating in the consumer-provider interactions, subordinate relationships and levels of trust, and types of interactions between the parties. In some cases, the degree of trust is based on the level of control organizations can exert an external service providers regarding the controls necessary for the practication of the service, information, or individual privacy and the evidence brought forth as to the effectiveness of the implemented controls. The level of control is established by the terms and conditions of the contracts or service-level agreements.	SR-2	

Control ID	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls Notes
SA-9 (4)	2	System and Services Acquisition External System Services Consistent Interests of Consumers and Providers	Take the following actions to verify that the interests of [Assignment: organization-defined external service providers] are consistent with and reflect organizational interests: [Assignment: organization-defined actions].	As organizations increasingly use external service providers, it is possible that the interests of the service provider may diverge from organizational interests. In such situations, simply having the required technical, management, or operational controls in place may not be sufficient if the providers that implement and manage those controls are not operating in a manner consistent with the interests of the consuming organizations. Actions that organizations take to address such concerns include requiring background checks for selected service provider personnel; examining ownership records; employing only trustworthy service providers, including providers with which organizations have had successful trust relationships; and conducting routine periodic, unscheduled visits to service provider, facilities.	
SA-9 (5)	2	System and Services Acquisition External System Services Processing, Storage, and Service Location	Restrict the location of [Selection (one or more): information processing; information or data; system services] to [Assignment: organization-defined locations] based on [Assignment: organization-defined requirements or conditions].	The location of information processing, information and data storage, or system services that are critical to arganizations can have a direct impact on the ability of those arganizations to successfully execute their missions and business functions. The impact occurs when external providers control the location of processing, storage, or services. The criteria that external providers use for the selection of processing, storage, or services locations may be different from the criteria organizations use. For example, organizations may desire that data or information storage locations are restricted to certain locations to help facilitate incident response activities in case of information security or privacy incidents. Incident response activities including forensis canalyses and after-the-fact investigations, may be adversely affected by the governing lows, policies, or protocols in the locations where processing and storage occur and/or the locations from which system services emanate.	SA-5, SR-4
SA-9 (6)	2	System and Services Acquisition External System Services Organization-controlled Cryptographic Keys	Maintain exclusive control of cryptographic keys for encrypted material stored or transmitted through an external system.	Mointaining exclusive control of cryptographic keys in an external system prevents decryption of organizational data by external system staff. Organizational control of cryptographic keys can be implemented by encrypting and decrypting data inside for argumentation as data is sent to and received from the external system or by employing a component that permits encryption and decryption functions to be local to the external system, but allows exclusive organizational access to the encryption keys.	Sc-12, Sc-13, St-4
SA-9 (7)	2	System and Services Acquisition External System Services Organization-controlled Integrity Checking	Provide the capability to check the integrity of information while it resides in the external system.	Storage of organizational information in an external system could limit visibility into the security status of its data. The ability for the organization to verify and validate the integrity of its stored data without transferring it out of the external system provides such visibility.	SI-7
SA-9 (8)	2	System and Services Acquisition External System Services Processing and Storage Location — U.s. Jurisdiction	Restrict the geographic location of information processing and data storage to facilities located within in the legal jurisdictional boundary of the United States.	The geographic location of information processing and data storage can have a direct impact on the oblity of organizations to successfully execute their core missions and business functions. High impact information and systems, if compromised or breached, can have a severe or catastrophic adverse impact on organizational assets and operations, individuals, other organizations, and the Nation. Restricting the processing and storage of high-impact information to facilities within the legal jurisdictional boundary of the United States provides greater control over such processing and storage.	SA-5, SR-4
SA-10	1	System and Services Acquisition Developer Configuration Management	Require the developer of the system, system component, or system service to: a. Perform configuration management during system, component, or service [Selection (one or more): design; development; implementation, operation; disposal; b. Document, manage, and control the integrity of changes to [Assignment: organization-defined configuration items under configuration management); c. Implement only organization-approved changes to the system, component, or service; d. Document approved changes to the system, component, or service and the potential security and privacy impacts of such changes; and e. Track security flaws and flaw resolution within the system, component, or service and report findings to [Assignment: organization-defined personnel].	Controls include protecting from unauthorized modification or destruction, the master	CM-2, CM-3, CM-4, CM-7, CM-7, CM-7, CM-7, CM-9, SA-4, SA-5, SA-8, SA-15, SI-2, SR-3, SR-4, SR-5, SR-6
SA-10 (1)	2	System and Services Acquisition Developer Configuration Management Software and Firmware Integrity Verification	Require the developer of the system, system component, or system service to enable integrity verification of software and firmware components.	Software and firmware integrity verification allows organizations to detect unauthorized changes to software and firmware components using developer-provided tools, techniques, and mechanism. The integrity checking mechanisms can also address counterfeiting of software and firmware components. Organizations verify the integrity of software and firmware components, for example, through secure one-way hashes provided by developers. Delivered software and firmware components also include any updates to such components.	SI-7, SR-11
SA-10 (2)	2	System and Services Acquisition Developer Configuration Management Alternative Configuration Management	Provide an alternate configuration management process using organizational personnel in the absence of a dedicated developer configuration management team.	Alternate configuration management processes may be required, for example, when organizations use commercial off-the-shell information technology products. Alternate configuration management processes include organizational personnel that review and approve proposed changes to systems, system components, and system services; and that conduct security and privacy impact analyses prior to the implementation of changes to systems, components, or services.	
SA-10 (3)	2	System and Services Acquisition Developer Configuration Management Hardware Integrity Verification	Require the developer of the system, system component, or system service to enable integrity verification of hardware components.	Hardware integrity verification allows organizations to detect unauthorized changes to hardware components using developer-provided tools, techniques, methods, and mechanisms. Organizations verify the integrity of hardware components, for example, with hard-to-copy lobels and verificable serial numbers provided by developers, and by requiring the implementation of anti-tamper technologies. Delivered hardware components also include hardware and firmware updates to such components.	SI-7
SA-10 (4)	2	System and Services Acquisition Developer Configuration Management Trusted Generation	Require the developer of the system, system component, or system service to employ tools for comparing newly generated versions of security-relevant hardware descriptions, source code, and object code with previous versions.	Trusted generation of descriptions, source code, and object code addresses authorized changes to hardware, software, and firmware components between versions during development. The focus is on the efficacy of the configuration management process by the developer to ensure that newly generated versions of security-relevant hardware descriptions, source code, and object code continue to enforce the security policy for the system, system component, or system service. In contrast, \$4-10(1) and \$4-10(3) allow arganizations to detect unauthorized changes to hardware, software, and firmware components using tools, techniques, or mechanisms provided by developers.

SA-10 (5)	2	System and Services Acquisition Developer	Require the developer of the system, system component, or system service to maintain the integrity of the	Mapping integrity for version control addresses changes to hardware, software, and	Melatica Controls	NO.
2.120(3)		System and actives apparently Developed Configuration Management Mapping Integrity for Version Control	mapping between the moster build data (hardware drawings and software/firmware code) describing the current version of security-relevant hardware, software, and firmware and the on-site master copy of the data for the current version.	immorphing integrity for each control outside selection and during system development life cycle updates. Maintaining the integrity between the master copies of security-relevant hardware, software, and firmware (including designs and source code) and the equivalent data in master copies in operational environments is essential to ensure the availability of organizational systems supporting critical missions and business functions.		
SA-10 (6)	2	System and Services Acquisition Developer Configuration Management Trusted Distribution	Require the developer of the system, system component, or system service to execute procedures for ensuring that security-relevant hardware, software, and firmware updates distributed to the organization are exactly as specified by the master copies.	The trusted distribution of security-relevant hardware, software, and firmware updates help to ensure that the updates are correct representations of the master copies maintained by the developer and have not been tampered with during distribution.		
SA-11	1	System and Services Acquisition Developer Testing and Evaluation	Require the developer of the system, system component, or system service, at all post-design stages of the system development life cycle, to: a. Develop and implement a plan for ongoing security and privacy assessments; b. Perform [Selection (one or more): unit; integration; system; regression] testing/evaluation [Assignment: organization-defined frequency] at [Assignment organization-defined depth and coverage]; c. Produce evidence of the execution of the assessment plan and the results of the testing and evaluation; d. Implement a verifiable flaw remediation process; and e. Correct flaws identified during testing and evaluation.	components. The interconnections or changes, including upgrading or replacing applications, operating systems, and firmware, may adversely affect previously implemented controls. Ongoing assessment during development allows for additional types of testing and evaluation that developers can conduct to reduce or eliminate potential flaws. Testing custom software applications may require approaches such as manual code review; security architecture review; penetration testing; and static analysis, dynamic analysis, pinary analysis, or a hybrid of the three analysis approaches. Developers can use the analysis approaches, along with security instrumentation and fuzzing, in a variety of tools and in source code reviews. The security and privacy assessment plans include the specific activities that developers plan to carry out, including the types of analyses, testing, evaluation, and reviews of software and firmware components, the degree of rigor to be applied, the frequency of the ongoing testing and evaluation, and the types of arrifacts produced during those processes. The depth of testing and evaluation, and they so and level of detail associated with the assessment process. The coverage of testing and evaluation refers to the region and level of other and the soft of the contracts of the evidence criteria for security and privacy assessment plans, flaw remediation processes, and the evidence that the plans and processes have been diligently applied. Methods for reviewing and protecting assessment plans, evidence, and documentation are commensurate with the security category or classification level of the system. Contracts may specify protection requirements for documentation.	CA-2, CA-7, CM-4, SA 3, SA-4, SA-5, SA-6, SA-15, SA-17, SI-2, SR 5, SR-6, SR-7	
5A-11 (1)	2	System and Services Acquisition Developer Testing and Evaluation Static Code Analysis	Require the devoloper of the system, system component, or system service to employ static code analysis tools to identify common flaws and document the results of the analysis.	Static code analysis provides a technology and methodology for security reviews and includes checking for weaknesses in the code and checking for incorporation of libraries or acher included code with known vulnerabilities on that are out-of-date and not supported. Static code analysis can be used to identify vulnerabilities and to enforce secure coding practices and Static code analysis is most effective when used early in the development process, when each code change can be automatically scanned for potential weaknesses. Static code analysis can provide clear remediation guidance along with defects to enable developers to fix such defects. Evidence of correct implementation of static analysis include aggregate defect density for critical defect types; evidence that defects were inspected by developers or security professionals; and evidence that defects were remediated. A high density of ignored findings, commanly referred to as false positives, indicates a potential problem with the analysis process or the analysis tool. In such cases, organizations weigh the validity of the evidence against evidence from other sources.		
SA-11 (2)	2	System and Services Acquisition Developer Testing and Evaluation Threat Modeling and Vulnerability Analyses	Require the developer of the system, system component, or system service to perform threat modeling and vulnerability analyses during development and the subsequent testing and evaluation of the system, component, or service that: (a) Uses the following contextual information: [Assignment: organization-defined information concerning impact, environment of operations, known or assumed threats, and acceptable risk levels]; (i) Conducts the following tools and methods: [Assignment: organization-defined tools and methods]; (i) Conducts the modeling and analyses at the following level of rigor: [Assignment: organization-defined breadth and depth of modeling and analyses]; and (d) Produces evidence that meets the following acceptance criteria: [Assignment: organization-defined acceptance criteria].	Systems, system components, and system services may deviate significantly from the functional and design specifications created during the requirements and design stages of the system development life cycle. Therefore, updates to threat modeling and vulnerability analyses of those systems, system components, and system services during development and prior to delivery are critical to the effective operation of those systems, components, and services. Threat modeling and vulnerability analyses at this stage of the system development life cycle ensure that design and implementation changes have been accounted for and vulnerabilities created because of those changes have been reviewed and mitigated. Related controls: PM-15, RA-3, RA-5.		
SA-11 (3)	2	System and Services Acquisition Developer Testing and Evaluation Independent Verification of Assessment Plans and Evidence	(a) Require an independent agent satisfying [Assignment: organization-defined independence criteria] to verify the correct implementation of the developer security and privacy assessment plans and the evidence produced during testing and evaluation, and (b) Verify that the independent agent is provided with sufficient information to complete the verification process	Independent agents have the qualifications, including the expertise, skills, training, certifications, and experience to verify the correct implementation of developer security and privacy assessment plans.	AT-3, RA-5	
SA-11 (4)		System and Services Acquisition Developer Testing and Evaluation Manual Code Reviews	or granted the authority to obtain such information. Require the developer of the system, system component, or system service to perform a manual code review of [Assignment: organization-defined specific code] using the following processes, procedures, and/or techniques: [Assignment: organization-defined processes, procedures, and/or techniques].	Manual code reviews are usually reserved for the critical software and firmware components of systems. Manual code reviews are effective in identifying weaknesses that require knowledge of the application's requirements or context which in most cases, are unavailable to automated analytic tools and techniques, for example, static and dynamic analysis. The benefits of manual code review include the ability to verify access control matrices against application controls and review detailed aspects of cryptographic implementations and controls.		
SA-11 (5)	2	System and Services Acquisition Developer Testing and Evaluation Penetration Testing	Require the developer of the system, system component, or system service to perform penetration testing: (a) At the following level of rigio; Assignment or organization-defined breadth and depth of testing); and (b) Under the following constraints: [Assignment: organization-defined constraints].	Penetration testing is an assessment methodology in which assessors, using all available information technology product or system documentation and working under specific constraints, attempt to circumvent implemented security and privacy features of information technology products and systems. Useful information for assessors conducting penetration testing includes product and system design specifications, source code, and administrator and operator manuals. Penetration testing can include white-box, gray-box, or black box testing with analyses performed by skilled professionals simulating adversary actions. The objective of penetration testing is to discover vulnerabilities in systems, system components and services resulting from implementation errors, confliquation fuelts, or other operational weaknesses or deficiencies. Penetration tests can be performed in conjunction with automated and manual code reviews to provide genetar levels of analysis than would ordinarily be possible. When user session information and other personally identifiable information is captured or recorded during penetration testing, such information is handled appropriately to protect privacy.	CA-8, PM-14, PM-25, PT-2, SA-3, SI-2, SI-6	

Control ID	Level	Control Name	Withdrawn	Control Text	Discussion	Related Controls	Notes
SA-11 (6)	2	System and Services Acquisition Developer Testing and Evaluation Attack Surface Reviews		Require the developer of the system, system component, or system service to perform attack surface reviews.	Attack surfaces of systems and system components are exposed areas that make those systems more vulnerable to attacks. Attack surfaces include any accessible areas where weaknesses of deflicencies in the nardware, software, and firmware components provide opportunities for adversaries to exploit vulnerabilities. Attack surface reviews ensure that developers analyze the design and implementation changes to systems and miligate attack vectors generated as a result of the changes. Correction of identified flaws includes deprecation of unsafe functions.	SA-15	
SA-11 (7)	2	System and Services Acquisition Developer Testing and Evaluation Verify Scope of Testing and Evaluation		Require the developer of the system, system component, or system service to verify that the scope of testing and evaluation provides complete coverage of the required controls at the following level of rigor: [Assignment: organization-defined breadth and depth of testing and evaluation].	Verifying that testing and evaluation provides complete coverage of required controls can be accomplished by a variety of analytic techniques ranging from informat lo formal. Each of these techniques provides an increasing level of assurance corresponding to the degree of formality of the analysis. Rigorously demonstrating control coverage at the highest levels of assurance can be provided using formal modeling and analysis techniques, including correlation between control implementation and corresponding test cases.	SA-15	
SA-11 (8)	2	System and Services Acquisition Developer Testing and Evaluation Dynamic Code Analysis		Require the developer of the system, system component, or system service to employ dynamic code analysis tools to identify common flaws and document the results of the analysis.	Dynamic cade analysis provides run-time verification of software programs, using tools capable of monitoring programs for memory carryption, user privilege Issues, and other potential security problems. Dynamic code analysis employs run-time tools to ensure that security functionality performs in the way it was designed. A specialized type of dynamic analysis, known as fuzz testing, induces program failures by deliberately introducing malformed or random data into software programs. Fuzz testing strategies derive from the intended use of applications and the associated functional and design specifications for the applications. To understand the scope of dynamic code analysis and hence the assurance provided, organizations may also consider conducting code coverage analysis (checking the degree to which the code has been tested using metrics such as percent of subroutines tested or percent of grogarm statements called during execution of the test suitely and/or concordance analysis (checking for words that are out of place in software code such as non-English language words or derogatory terms).		
SA-11 (9)	2	System and Services Acquisition Developer Testing and Evaluation Interactive Application Security Testing		Require the developer of the system, system component, or system service to employ interactive application security testing tools to identify flaws and document the results.	Interactive (also known as instrumentation-based) application security testing is a method of detecting vulnerabilities by observing applications as they run during testing. The use of instrumentation relies an direct measurements of the octual running applications, and uses access to the code, user interaction, libraries, frameworks, backend connections, and configurations to measure control effectiveness directly. When combined with analysis techniques, interactive application security testing can identify a broad range of potential winterabilities and configurations transcribed pictiveness. Instrumentation-based testing works in real time and can be used continuously throughout the system development life cycle.

Accurately and completely describes the required security functionality, and the allocation of controls amphysical and logical components; and c. Expresses how individual security functions, mechanisms, and services work together to provide required security capabilities and a unified approach to protection.	could also be applied to internal (in-house) development. In contrast, PL-8 is directed at internal developers to ensure that organizations develop a security architecture and that the architecture is integrated with the enterprise architecture. The distinction between SA-	NEMECO CONTOLS PL-2, PL-8, PM-7, SA- 3, SA-4, SA-8	Notes
SA-17 (1)	2	System and Services Acquisition Developer Security Architecture and Design Formal Policy Model	Require the developer of the system, system component, or system service to: (a) Produce, as an integral part of the development process, a formal policy model describing the [Assignmen arganization-defined elements of organizational security policy) to be enforced; and (b) Prove that the formal policy model is internally consistent and sufficient to enforce the defined elements of the arganizational security policy when implemented.	components of systems can be modeled. Generally, formal specifications are scoped to the	AC-3, AC-4, AC-25	
SA-17 (2)	2	System and Services Acquisition Developer Security Architecture and Design Security-relevant Components	Require the developer of the system, system component, or system service to: (a) Define security-relevant hardware, software, and firmware; and (b) Provide a rationale that the definition for security-relevant hardware, software, and firmware is complete	The security-relevant hardware, software, and firmware represent the portion of the system, component, or service that is trusted to perform correctly to maintain required security properties.	AC-25, SA-5	
SA-17(3)	2	System and Services Acquisition Developer Security Architecture and Design Formal Correspondence	Require the developer of the system, system component, or system service to: (a) Produce, as an integral part of the development process, a formal top-level specification that specifies the interfaces to security-relevant hardware, software, and firmware in terms of exceptions, error messages, and effects; (b) Show via proof to the extent feasible with additional informal demonstration as necessary, that the forms top-level specification is consistent with the farmal policy model; (c) Show via informal demonstration, that the formal top-level specification completely covers the interfaces security-relevant hardware, software, and firmware; (d) Show that the formal top-level specification is an accurate description of the implemented security-relevant hardware, software, and firmware, and firmware mechanisms not addressed in the formal top-level specification but strictly internal to the security-relevant hardware, software, and firmware.	system description is correctly implemented by a description of some lower level, including a hardware description. Consistency between the formal top-level specification and the formal policy models is generally not amenable to being fully proven. Therefore, a combination of formal and informal methods may be needed to demonstrate such consistency. Consistency between the formal top-level specification and the actual	AC-3, AC-4, AC-25, SA-4, SA-5	
SA-17(4)	2	System and Services Acquisition Developer Security Architecture and Design Informal Correspondence	Require the developer of the system, system component, or system service to: (a) Produce, as an integral part of the development process, an informal descriptive top-level specification th specifies the interfaces to security-relevant hardware, software, and firmware in terms of exceptions, error messages, and effects; (b) Snow via (Selection: informal demonstration; convincing argument with formal methods as feasible] that descriptive top-level specification is consistent with the formal policy model; (c) Snow via informal demonstration, that the descriptive top-level specification completely covers the interfact to security-relevant hardware, software, and firmware; (d) Show that the descriptive top-level specification is an accurate description of the interfaces to security-relevant hardware, software, and firmware; and (e) Describe the security-relevant hardware, software, and firmware mechanisms not addressed in the descriptive top-level specification but strictly internal to the security-relevant hardware, software, and firmware.	that any additional code or implementation details present has no impact on the behaviors or policies being madeled. Consistency between the descriptive top-level specification (i.e., he high-level/low-level design) and the farmal policy model is generally not amenable to being fully proven. Therefore, a combination of formal and informal methods may be needed use show such consistency. Hadroware, software and firmware mechanisms strictly internal to security-relevant hardware, software, and firmware include mapping registers and direct memory input and output.	AC-3, AC-4, AC-25, SA-4, SA-5	
SA-17 (5)	2	System and Services Acquisition Developer Security Architecture and Design Conceptually Simple Design	Require the developer of the system, system component, or system service to: (a) Design and structure the security-relevant hardware, software, and firmware to use a complete, concepts simple protection mechanism with precisely defined semantics; and (b) Internally structure the security-relevant hardware, software, and firmware with specific regard for this mechanism.	olso less prome to error (see AC-25, SA-8(13)). The principle of reduced complexity applies to any aspect of a system, but it has particular importance for security due to the various analyses performed to obtain evidence about the emergent security property of the system. For such analyses to be successful, a small and simple design is essential. Application of the principle of reduced complexity contributes to the ability of system developers to understand the correctness and completeness of system security functions and facilitates the identification of potential unkerabilities. The corollary of reduced complexity states that the simplicity of the system is directly related to the number of vulnerabilities it will contain—that is, simpler systems contain fewer vulnerabilities. An important benefit of reduced complexity is that it is easier to understand whether the security policy has been captured in the system design, and that fewer vulnerabilities are likely to be introduced during engineering development. An additional benefit is that only such conclusion about correctness, completeness, and existence of vulnerabilities can be reached with a higher degree of assurance in contrast to conclusions reached in situations where the system design is inherently more complex.		
SA-17 (6)	2	System and Services Acquisition Developer Security Architecture and Design Structure for Testing	Require the developer of the system, system component, or system service to structure security-relevant hardware, software, and firmware to facilitate testing.	Applying the security design principles in [59 800-160 v1] promotes complete, consistent, and comprehensive testing and evoluation of systems, system components, and services. The thoroughness of such testing contributes to the evidence produced to generate an effective assurance case or argument as to the trustworthiness of the system, system component, or service.	SA-5, SA-11

SA-17 (7)	2	Control Name System and Services Acquisition Developer Security		Require the developer of the system, system component, or system service to structure security-relevant		AC-5, AC-6, SA-8	Notes
	-	Architecture and Design Structure for Least Privilege		hardware, software, and firmware to facilitate controlling access with least privilege.	to accomplish its specified functions, but no more (see SA-8(14)). Applying the principle of	., . ,	
1 '					least privilege limits the scope of the component's actions, which has two desirable effects.		
1 '					First, the security impact of a failure, corruption, or misuse of the system component results		
1					in a minimized security impact. Second, the security analysis of the component is simplified.		
1 '					Least privilege is a pervasive principle that is reflected in all aspects of the secure system design. Interfaces used to invoke component capability are available to only certain subsets		
1 '					of the user population, and component design supports a sufficiently fine granularity of		
1 '					privilege decomposition. For example, in the case of an audit mechanism, there may be an		
1 '					interface for the audit manager, who configures the audit settings; an interface for the		
1					audit operator, who ensures that audit data is safely collected and stored; and, finally, yet		
1					another interface for the audit reviewer, who has need only to view the audit data that has		
1 '					been collected but no need to perform operations on that data.		
1 '					In addition to its manifestations at the system interface, least privilege can be used as a guiding principle for the internal structure of the system itself. One aspect of internal least		
1					privilege is to construct modules so that only the elements encapsulated by the module are		
1					directly operated upon by the functions within the module. Elements external to a module		
1					that may be affected by the module's operation are indirectly accessed through interaction		
1					(e.g., via a function call) with the module that contains those elements. Another aspect of		
1					internal least privilege is that the scope of a given module or component includes only those		
1					system elements that are necessary for its functionality, and that the access modes to the		
1					elements (e.g., read, write) are minimal.		
1 '

SA-21 (1)	2	System and Services Acquisition Developer Screening X Validation of Screening				[Withdrawn: Incorporated into SA-21]
SA-22	1	System and Sevening System of Sevening System Components	a. Replace system components when support for the components is no longer available from the developer, vendor, or manufacturer; or b. Provide the following options for alternative sources for continued support for unsupported components [Selection (one or more): in-house support; [Assignment: organization-defined support from external providers]].	Support for system components includes software patches, firmware updates, replacement parts, and maintenance contracts. Unsupported components, for example, when vendors no longer provide critical software patches or product updates, provide an opportunity for adversaries to exploit weaknesses in the installed components. Exceptions to replacing unsupported system components include systems that provide critical mission or business capability where newer technologies are not available or where the systems are so isolated that installing replacement components is not an option. Alternative sources for support address the need to provide continued support for system components that are no longer supported by the original manufacturers, developers, or vendors when such components remain essential to organizational mission and business operations. If necessary, organizations can establish in-house support by developing customized patches for critical software components or alternatively, obtain the services of external providers who through contractual relationships, provide ongoing support for the designated unsupported components. Such contractual relationships can include Open Source Software value-added vendors.	PL-2, SA-3	
SA-22 (1)	2	System and Services Acquisition Unsupported X System Components Alternative Sources for Continued Support				[Withdrawn: Incorporated into SA-22]
SA-23		System and Services Acquisition Specialization	Employ [Selection (one or more): design modification; augmentation; reconfiguration] on [Assignment: organization-defined systems or system components] supporting mission essential services or functions to increase the trustworthiness in those systems or components.	It is often necessary for a system or system component that supports mission essential services or functions to be enhanced to maximize the trustworthiness of the resource. Sometimes this enhancement is done at the design level. In other instances, it is done post-design, either through modifications of the system in question or by augmenting the system with additional components. For example, supplemental authentication or non-reputation functions may be added to the system to enhance the identity of critical resources to other resources that depend upon the organization-defined resources.	RA-9, SA-8	
SC-1		System and Communications Protection Yolicy and Procedures	a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more): organization-level; mission/business process-level; system-level] system and communications protection policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and (b) is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the system and communications protection policy and the associated system and communications protection controls; b. Designate an [Assignment: organization-defined official] to manage the development, documentation, and dissemination of the system and communications protection policy and procedures; and c. Review and update the current system and communications protection: 1. Policy [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the SC family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and privacy sasurance. Therefore, it is important that security and privacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy porgams and for systems, if needed. Procedures describe how the policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures the documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.		
SC-2		System and Communications Protection Separation of System and User Functionality	Separate user functionality, including user interface services, from system management functionality.	System management functionality includes functions that are necessary to administer databases, network components, workstations, or servers. These functions typically require privileged user access. The separation of user functions from system management functions is physical or logical. Organizations implement separation of system management functions from user functions, for example, by using different computers, instances of operating systems, central processing units, or network addresses; by employing virtualization techniques; or some combination of rhese or other methods. Separation of system management functions from user functions includes web administrative interfaces that employ separate authentication methods for users of any other system resources. Separation of system and user functions may include isolating administrative interfaces on different domains and with additional access controls. The separation of system and user functionality can be achieved by applying the systems security engineering design principles in SA8 including SA8(1), SA8(1), SA8(1), SA8(10), SA8(12), SA8(13), SA8(14), and SA8(18).		
SC-2 (1)	2	System and Communications Protection Separation of System and User Functionality Interfaces for Non- privileged Users	Prevent the presentation of system management functionality at interfaces to non-privileged users.	Preventing the presentation of system management functionality at interfaces to non- privileged users ensures that system administration options, including administration privileges, are not available to the general user population. Restricting user access also prohibits the use of the grey-out option commonly used to eliminate accessibility to such information. One potential solution is to withhold system administration options until users establish sessions with administrator privileges.	AC-3	
SC-2 (2)		System and Communications Protection Separation of System and User Functionality Disassociability	Store state information from applications and software separately.	If a system is compromised, storing applications and software separately from state information about users' interactions with an application, may better protect individuals' privacy.		
SC-3		System and Communications Protection Security Function Isolation	Isolate security functions from nonsecurity functions.	boundary implemented via partitions and domains. The isolation boundary controls access to and protects the integrity of the hardware, software, and firmware that perform those security functions. Systems implement code separation in many ways, for example, through the provision of security kernels via processor rings or processor modes. For non-kernel code, security function isolation is often achieved through file system protections that protect the code on disk and address space protections that protect executing code. Systems can restrict access to security functions using access control mechanisms and by implementing least privilege capabilities. While the ideal is for all code within the defined security function isolation boundary to only contain security-relevant code, it is sometimes encessary to include onosecurity functions within the isolation boundary as an exception. The isolation of security functions from nonsecurity functions can be achieved by applying the systems security engineering design principles in As in Including SA-8(1), SA-8(3), SA-8(4), SA-8(13), SA-8(13), SA-8(14), and SA-8(18).	5, SA-8, SA-15, SA-17,	,
SC-3 (1)	2	System and Communications Protection Security Function Isolation Hardware Separation	Employ hardware separation mechanisms to implement security function isolation.	Hardware separation mechanisms include hardware ring architectures that are implemented within microprocessors, and hardware-enforced address segmentation used to support logically distinct storage objects with separate attributes (i.e., readable, writeable).

		Functionality		the security function boundary. Nonsecurity functions contained within the isolation		
		,		boundary are considered security-relevant because errors or malicious code in the software,		
				can directly impact the security functions of systems. The fundamental design objective is		
				that the specific portions of systems providing information security are of minimal size and		
				complexity. Minimizing the number of nonsecurity functions in the security-relevant system		
				components allows designers and implementers to focus only on those functions which are		
				necessary to provide the desired security capability (typically access enforcement). By		
				minimizing the nonsecurity functions within the isolation boundaries, the amount of code		
				that is trusted to enforce security policies is significantly reduced, thus contributing to		
				understandability.		
SC-3 (4)	2	System and Communications Protection Security	Implement security functions as largely independent modules that maximize internal cohesiveness within	The reduction in inter-module interactions helps to constrain security functions and manage

SC-7 (1)	2	System and Communications Protection Boundary Protection Physically Separated Subnetworks	Х				[Withdrawn: Incorporated into SC-7]
SC-7 (2)	2	System and Communications Protection Boundary Protection Public Access	Х				[Withdrawn: Incorporated into SC-7]
SC-7 (3)	2	System and Communications Protection Boundary Protection Access Points		Limit the number of external network connections to the system.	limiting the number of external network connections facilitates monitoring of inbound and outbound communications traffic. The Trusted Internet Connection [DHS TIC] initiative is an example of a federal guideline requiring limits on the number of external network connections. Limiting the number of external network connections to the system is important during transition periods from older to newer technologies (e.g., transitioning from IPM to IPV6 network protocols). Such transitions may require implementing the older and newer technologies simultaneously during the transition period and thus increase the number of access points to the system.		
SC-7 (4)	2	System and Communications Protection Boundary Protection External Telecommunications Services		(a) implement a managed interface for each external telecommunication service; (b) Establish a traffic flow policy for each managed interface; (c) Protect the confidentiality and integrity of the information being transmitted across each interface; (d) Document each exception to the traffic flow policy with a supporting mission or business need and duration of that need; (e) Review exceptions to the traffic flow policy JAssignment: organization-defined frequency] and remove exceptions that ore no longer supported by an explicit mission or business need; (f) Prevent unauthorized exchange of control plane traffic with external networks; (g) Publish information to enable remote networks to detect unauthorized control plane traffic from internal networks; and	External commercial telecommunications services may provide data or voice communications services. Examples of control plane traffic include routing, domain name system (DNS), and management. Industhorized control plane traffic can occur for example, through a technique known as "spoofing."	AC-3, SC-8	
SC-7 (5)	2	System and Communications Protection Boundary Protection Deny by Default — Allow by Exception		Deny network communications traffic by default and allow network communications traffic by exception [Selection (one or mare): at managed interfaces; for [Assignment: organization-defined systems]].	Denying by defouth and allowing by exception applies to inbound and outbound network communications traffic. A deny-all, permit-by-exception network communications traffic policy ensures that only those system connections that are essential and approved are allowed. Deny by default, allow by exception also applies to a system that is connected to an external system.		
SC-7 (6)	2	System and Communications Protection Boundary Protection Response to Recognized Failures	Х				[Withdrawn: Incorporated into SC-7 (18)]
SC-7 (7)	2	System and Communications Protection Boundary Protection Prevent Split Tunneling for Remote Devices		Prevent a remote device from simultaneously establishing non-remote connections with the system and communicating via some other connection to resources in external networks.	Prevention of split tunneling is implemented in remote devices through configuration settings to disable split tunneling in those devices, and by preventing those configuration settings from being configurable by users. Prevention of split tunneling is implemented within the system by the detection of split tunneling (or of configuration settings that allow split tunneling) in the remote device, and by prohibiting the connection if the remote device is using split tunneling. Split tunneling might be desirable by remote users to communicate with local system resources such as printers or file servers. However, split tunneling can focilitate unauthorized external connections, making the system vulnerable to attack and to exfiltration of organizational information.		
SC-7 (8)	2	System and Communications Protection Boundary Protection Route Traffic to Authenticated Proxy Servers		Route (Assignment: organization-defined internal communications traffic) to (Assignment: organization-defined external networks) through authenticated proxy servers at managed interfaces.	External networks are networks outside of organizational control. A proxy server is a server (i.e., system or application) that acts as an intermediary for clients requesting system resources from non-arganizational or other organizational servers. System resources that may be requested include files, connections, web pages, or services. Client requests established through a connection to a pray server ore assessed to manage complexity and to provide additional protection by limiting direct connectivity. Web content filtering devices are one of the most common prays servers providing access to the Internet. Prays servers can support logging of Transmission Control Protocol sessions and blocking specific Uniform Resource Locators, Internet Protocol addresses, and domain names. Web proxies can be configured with organization-defined lists of authorized and unauthorized websites. Note that proxy servers may inhibit the use of virtual private networks (VPNs) and create the potential for "man-in-the-middle" attacks (depending on the implementation).	AC-3	
SC-7 (9)	2	System and Communications Protection Boundary Protection Restrict Threatening Outgoing Communications Traffic		(a) Detect and deny outgoing communications traffic posing a threat to external systems; and (b) Audit the identity of internal users associated with denied communications.		AU-2, AU-6, SC-5, SC- 38, SC-44, SI-3, SI-4	

Control ID I	evel	Control Name Withdrawn	Control Text	Discussion	Related Controls Notes	
SC-7 (10)	2	System and Communications Protection Boundary Protection Prevent Exfiltration	(a) Prevent the exfiltration of information; and (b) Conduct exfiltration tests [Assignment: organization-defined frequency].	This control applies to intentional and unintentional exfiltration of information. Controls to prevent exfiltration of information from systems may be implemented at internal endpoints, external boundaries, and across managed interfaces and include adherence to protocol formats; monitoring for beaconing activity from systems; disconnecting external network interfaces except when explicitly needed; employing tarific profile analysis to detect deviations from the volume and types of traffic expected or call backs to command and control centers; monitoring for stegnongraphy, ideassembling and reassembling packet headers; and employing data loss and data leokage prevention tools. Devices that enforce strict adherence to protocal formats include deep packet inspection firewalls and XML gateways. The devices verify adherence to protocal formats and specifications at the application layer and tentily vulnerabilities that cannot be detected by devices operating at the network or transport layers. Prevention of exfiltration is similar to data loss prevention and is closely associated with cross-domain solutions and system guards enforcing information flow requirements.	AC-2, SI-3	
SC-7 (11)	2	System and Communications Protection Boundary Protection Restrict Incoming Communications Traffic	Only allow incoming communications from [Assignment: organization-defined authorized sources] to be routed to [Assignment: organization-defined authorized destinations].	General source address validation techniques should be applied to restrict the use of lilegal and unallocated source address can do surce address that should only be used inside the system boundary. Restriction of incoming communications traffic provides determinations that source and destination address pairs represent authorized or allowed communications. Determinations can be based on several factors, including the presence of such address pairs in the lists of authorized or allowed communications, the absence of such address pairs in lists of nunathorized or allowed assist on meeting more general rules for authorized or allowed source and destination pairs. Strong authentication of network addresses is not possible without the use of explicit security protocols and thus, addresses can often be spoofed. Further, identity-based incoming traffic restriction methods can be employed, including router access control lists and firewall rules.	AC-3	
SC-7 (12)		System and Communications Protection Boundary Protection Host-based Protection	Implement [Assignment: organization-defined host-based boundary protection mechanisms] at [Assignment: organization-defined system components].	Host-based boundary protection mechanisms include host-based firewalls. System components employing host-based boundary protection mechanisms include servers, workstations, notebook computers, and mobile devices.		
SC-7 (13)	2	System and Communications Protection Boundary Protection Isolation of Security Tools, Mechanisms, and Support Components	Isolate [Assignment: organization-defined information security tools, mechanisms, and support components] from other internal system components by implementing physically separate subnetworks with managed interfaces to other components of the system.	Physically separate subnetworks with managed interfaces are useful, for example, in isolating computer network defenses from critical operational processing networks to prevent adversaries from discovering the analysis and forensics techniques employed by arganizations.	SC-2, SC-3	
SC-7 (14)	2	System and Communications Protection Boundary Protection Protect Against Unauthorized Physical Connections	Protect against unauthorized physical connections at [Assignment: organization-defined managed interfaces].	Systems operating at different security categories or classification levels may share comman physical and environmental controls, since the systems may share space within the same facilities. In practice, it is possible that these separate systems may share common equipment rooms, wiring closets, and cable distribution paths. Protection against unauthorized physical connections can be achieved, for example, by using clearly identified and physically separated cable troys, connection frames, and patch panels for each side of managed interfaces with physical access controls enforcing limited authorized access to these items.	PE-4, PE-19	
SC-7 (15)	2	System and Communications Protection Boundary Protection Networked Privileged Accesses	Route networked, privileged accesses through a dedicated, managed interface for purposes of access control and auditing.	Privileged access provides greater accessibility to system functions, including security functions. Adversaries typically attempt to gain privileged access to systems through remote access to acuse adverse mission or business impact, for example, by exflitrating sensitive information or bringing down a critical system capability. Routing networked, privileged access requests through a dedicated, managed interface an facilitate strong access controls (including strong authentication) and a comprehensive auditing capability.	AC-2, AC-3, AU-2, SI- 4	
SC-7 (16)	2	System and Communications Protection Boundary Protection Prevent Discovery of Components and Devices	Prevent the discovery of specific system components that represent a managed interface.	This control enhancement protects network addresses of system components that are part of managed interfaces from discovery through common tools and techniques used to identify devices on networks. Network addresses are not available for discovery, requiring airok knowledge for access. Preventing discovery of components and devices can be accomplished by not publishing network addresses, using network address translation, or not entering the addresses in domain name systems. Another prevention technique is to periodically change network addresses.		
SC-7 (17)	2	System and Communications Protection Boundary Protection Automated Enforcement of Protocol Formats	Enforce adherence to protocol formats.	System components that enforce protocol formats include deep packet inspection firewalls and XML gateways. The components verify adherence to protocol formats and specifications at the application layer and identify vulnerabilities that cannot be detected by devices operating at the network or transport layers.	SC-4	
SC-7 (18)	2	System and Communications Protection Boundary Protection Fail Secure	Prevent systems from entering unsecure states in the event of an operational failure of a boundary protection device.	Fail secure is a condition achieved by employing mechanisms to ensure that in the event of operational failures of boundary protection devices at managed interfaces, systems do not enter into unsecure states where intended security properties no longer hold. Managed interfaces include routers, firewalls, and application gateways residing an protected subnetworks commonly referred to as demilitarized zones. Failures of boundary protection devices cannot lead to, or cause information external to the devices to enter the devices, nor an failures permit unauthorized information releases.	CP-2, CP-12, SC-24	
SC-7 (19)	2	System and Communications Protection Boundary Protection Block Communication from Non- organizationally Configured Hosts	Black inbound and outbound communications traffic between [Assignment: organization-defined communication clients] that are independently configured by end users and external service providers.	Communication clients independently configured by end users and external service providers include instant messaging clients. Traffic blocking does not apply to communication clients that are configured by organizations to perform authorized functions.		
SC-7 (20)	2	System and Communications Protection Boundary Protection Dynamic Isolation and Segregation	Provide the copability to dynamically isolate [Assignment: organization-defined system components] from other system components.			

Control ID	Lovel	Control Name Withdrawn	Control Toyl	Discussion	Doloted Controls No	ntan
SC-7 (21)	2	System and Communications Protection Boundary	Control Text Employ boundary protection mechanisms to isolate [Assignment: organization-defined system components]	Organizations can isolate system components performing different missions or business	CA-9. SC-3	oces .
30-7 (21)	2	Protection Isolation of System Components	supporting [Assignment: organization-defined missions and/or business functions].	functions. Such isolation limits unauthorized information flows amona system components	CA-5, 5C-5	
		Protection isolation of System components	supporting [Assignment: Organization-defined missions and/or business functions].	and provides the opportunity to deploy greater levels of protection for selected system		
				components. Isolating system components with boundary protection mechanisms provides		
				the capability for increased protection of individual system components and to more		
				effectively control information flows between those components. Isolating system		
				components provides enhanced protection that limits the potential harm from hostile cyber-		
				attacks and errors. The degree of isolation varies depending upon the mechanisms chosen.		
				Boundary protection mechanisms include routers, gateways, and firewalls separating		
				system components into physically separate networks or subnetworks; virtualization		
				techniques; cross-domain devices separating subnetworks; and encrypting information		
				flows among system components using distinct encryption keys.		
SC-7 (22)	2	System and Communications Protection Boundary	Implement separate network addresses to connect to systems in different security domains.	The decomposition of systems into subnetworks (i.e., subnets) helps to provide the

SC-7 (29)	2	System and Communications Protection Boundary	Implement [Selection: physically; logically] separate subnetworks to isolate the following critical system	Separating critical system components and functions from other noncritical system		
		Protection Separate Subnets to Isolate Functions	components and functions: [Assignment: organization-defined critical system components and functions].	components and functions through separate subnetworks may be necessary to reduce the		
				susceptibility to a catastrophic or debilitating breach or compromise resulting in system		
				failure. For example, physically separating the command and control function from the		
				entertainment function through separate subnetworks in a commercial aircraft provides an		
				increased level of assurance in the trustworthiness of critical system functions.		
SC-8	1	System and Communications Protection	Protect the [Selection (one or more): confidentiality; integrity] of transmitted information.	Protecting the confidentiality and integrity of transmitted information applies to internal	AC-17, AC-18, AU-10,	
I		Transmission Confidentiality and Integrity		and external networks, and any system components that can transmit information,	IA-3, IA-8, IA-9, MA-	
					4, PE-4, SA-4, SA-8,	
I					SC-7, SC-16, SC-20,	
I					SC-23, SC-28	
I				and integrity of information can be accomplished by physical means or by logical means.	, 50 20	
				Physical protection can be achieved by using protected distribution systems. A protected		
I				distribution system is a term for wireline or fiber-optics telecommunication system that		
I				includes terminals and adequate acoustical, electrical, electromagnetic, and physical		
I				controls to permit its use for the unencrypted transmission of classified information. Logical		
I				protection can be achieved by employing encryption techniques.		
I				Organizations relying on commercial providers offering transmission services as commodity		
				services rather than as fully dedicated services, may find it difficult to obtain the necessary		
I				assurances regarding the implementation of needed controls for transmission		
I				confidentiality and integrity. In such situations, organizations determine what types of		
I				confidentiality or integrity services are available in standard, commercial		
I				telecommunication service packages. If it is not feasible to obtain the necessary controls		
I				and assurances of control effectiveness through appropriate contracting vehicles,		
I						
				organizations can implement appropriate compensating controls.		
I						
	-					
SC-8 (1)	2	System and Communications Protection	Implement cryptographic mechanisms to [Selection (one or more): prevent unauthorized disclosure of		SC-13	
		Transmission Confidentiality and Integrity	information; detect changes to information] during transmission.	transmission. Cryptographic mechanisms that protect the confidentiality and integrity of		
		Cryptographic Protection		information during transmission include TLS and IPSec. Cryptographic mechanisms used to		
				protect information integrity include cryptographic hash functions that have application in		
				digital signatures, checksums, and message authentication codes. SC-13 is used to specify		
				the specific protocols, algorithms, and algorithm parameters to be implemented on each		
				transmission path.		
SC-8 (2)	2	System and Communications Protection	Maintain the [Selection (one or more): confidentiality; integrity] of information during preparation for	Information can be either unintentionally or maliciously disclosed or modified during

				I .		

SC-8 (3)	evel 2	Control Name System and Communications Protection Transmission Confidentiality and Integrity Cryptographic Protection for Message Externals	In Control Text Implement cryptographic mechanisms to protect message externals unless otherwise protected by [Assignment: organization-defined alternative physical controls].	Discussion Cryptographic protection for message externals addresses protection from unauthorized disclosure of information. Message externals include message headers and routing information. Cryptographic protection prevents the exploitation of message externals and applies to internal and external networks or links that may be visible to individuals who are not authorized users. Header and routing information is sometimes transmitted in clear text (i.e., unencrypted) because the information is not identified by organizations as having significant value or because encrypting the information can result in lower network performance or higher costs. Alternative physical controls include protected distribution systems.	Related Controls SC-12, SC-13	Notes
SC-8 (4)	2	System and Communications Protection Transmission Confidentiality and Integrity Conceal or Randomize Communications	Implement cryptographic mechanisms to conceal or randomize communication patterns unless otherwise protected by [Assignment: organization-defined alternative physical controls].	Conceoling or randomizing communication patterns addresses protection from unauthorized disclosure of information. Communication patterns include frequency, periods, predictability, and amount. Changes to communications patterns can reveal information having intelligence value especially when combined with other available information releated to the missions and business functions of the organization. This control enhancement prevents the derivation of intelligence based on communications patterns and applies to both internal and external networks or links that may be visible to individuous who are not authorized users. Encrypting the links and transmitting in continuous, fixed or random patterns prevents the derivation of intelligence from the system communications patterns. Alternative physical controls include protected distribution systems.	SC-12, SC-13	
SC-8 (5)	2	System and Communications Protection Transmission Confidentiality and Integrity Protected Distribution System	Implement [Assignment: organization-defined protected distribution system] to [Selection (one or more): preven unauthorized disclosure of information; detect changes to information) during transmission.	The purpose of a protected distribution system is to deter, detect and/or make difficult physical access to the communication lines carrying national security information.		
SC-9	1	System and Communications Protection Transmission Confidentiality	([Withdrawn: Incorporated into SC-8]
SC-10	1	Transmission Communications Protection Network Disconnect	Terminate the network connection associated with a communications session at the end of the session or after [Assignment: organization-defined time-period] of inactivity.	Network disconnect applies to internal and external networks. Terminating network connections associated with specific communications sessions includes de-allocating TCP/IP address or port pairs at the operating system level and de-allocating the networking assignments at the application level if multiple application sessions are using a single operating system-level network connection. Periods of inactivity may be established by organizations and include time-periods by type of network access or for specific network accesses.	AC-17, SC-23	
SC-11	1	System and Communications Protection Trusted Path	a. Provide a [Selection: physically, logically] isolated trusted communications path for communications between the user and the trusted components of the system; and b. Permit users to invoke the trusted communications path for communications between the user and the following security functions of the system, including at a minimum, authentication and re-authentication: [Assignment: organization-defined security functions].	Trusted paths are mechanisms by which users (through input devices) can communicate directly with security functions of systems with the requisite assurance to support security policies. These mechanisms can be activated only by users or the security functions of organizational systems. User responses via trusted paths are protected from modifications by or disclosure to untrusted applications. Organizations employ trusted paths for trustworthy, high-assurance connections between security functions of systems and users, including during system logons. The original implementations of trusted path employed an out-of-band signal to initiate the path, for example using the <breaks <ctrl="" a="" be="" can="" characters="" combination="" could="" does="" example,="" for="" hijacked="" implementations,="" in="" key="" key,="" later="" not="" spoofed.="" that="" the="" transmit="" used,="" was="" which=""> + ACIL> + OEIL> keys. Note, however, that any such key combinations are platform-specific and may not provide a trusted path implementation in every case. Enforcement of trusted communications paths is typically provided by a specific implementation that meets the reference monitor concept.</breaks>	AC-16, AC-25, SC-12, SC-23	
SC-11 (1)	2	System and Communications Protection Trusted Path Irrefutable Communications Path	(a) Provide a trusted communications path that is irrefutably distinguishable from other communications paths; and (b) Initiate the trusted communications path for communications between the [Assignment: organization-defined security functions] of the system and the user.	An irrefutable communications path permits the system to initiate a trusted path which necessitates that the user can unmistakably recognize the source of the communication as a trusted system component. For example, the trusted path may appear in an area of the display that other applications cannot access or be based on the presence of an identifier that cannot be soofed.		
SC-12	1	System and Communications Protection Cryptographic Key Establishment and Management	Establish and manage cryptographic keys when cryptography is employed within the system in accordance with the following key management requirements: [Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction].	Cryptographic key management and establishment can be performed using manual procedures or automated mechanisms with supporting manual procedures. Or granizations define key management requirements in accordance with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines, specifying appropriate options,	SC-11, SC-13, SC-17, SC-20, SC-37, SC-40,	
SC-12 (1)	2	System and Communications Protection Cryptographic Key Establishment and Management Availability	Mointain availability of information in the event of the loss of cryptographic keys by users.	Escrowing of encryption keys is a common practice for ensuring availability in the event of loss of keys. A forgotten passphrase is an example of losing a cryptographic key.		
SC-12 (2)	2	System and Communications Protection Cryptographic Key Establishment and Management Symmetric Keys	Produce, control, and distribute symmetric cryptographic keys using [Selection: NIST FIPS-validated; NSA- approved] key management technology and processes.	[SP 800-564], [SP 800-568], and [SP 800-56C] provide guidance on cryptographic key establishment schemes and key derivation methods. [SP 800-57-1], [SP 800-57-2], and [SP 800-57-3] provide guidance on cryptographic key management.		
SC-12 (3)	2	System and Communications Protection Cryptographic Key Establishment and Management Asymmetric Keys	Produce, control, and distribute asymmetric cryptographic keys using Iselection: NSA-approved key management technology and processes; propositioned keying material; Do-approved or Doi-sisued Medium Assurance PKI certificates; DoD-approved or DoD-issued Medium Hardware Assurance PKI certificates and hardware security tokens that protect the user's private key, certificates issued in accordance with organization- defined requirements].	[SP 800-564], [SP 800-568], and [SP 800-56C] provide guidance on cryptographic key establishment schemes and key derivation methods. [SP 800-57-2], [SP 800-57-2], and [SP 800-57-3] provide guidance on cryptographic key management.		
SC-12 (4)	2	System and Communications Protection Cryptographic Key Establishment and Management PKI Certificates				[Withdrawn: Incorporated into SC-12]
SC-12 (5)	2	System and Communications Protection Cryptographic Key Establishment and Management PKI Certificates / Hardware Tokens				[Withdrawn: Incorporated into SC-12]
SC-12 (6)	2	System and Communications Protection Cryptographic Key Establishment and Management Physical Control of Keys	Mointain physical control of cryptographic keys when stored information is encrypted by external service providers.	For organizations using external service providers, for example, cloud service providers or data center providers, physical control of cryptographic keys provides additional assurance that information stored by such external providers is not subject to unauthorized disclosure or modification.		

Control ID	Lorent	Control Name	A PAIn donner	Control Ton	Planustan	Deleted Controls	Mater
SC-13	1	Control Name System and Communications Protection Cryptographic Protection		Control Text a. Determine the [Assignment: organization-defined cryptographic uses]; and b. Implement the following types of cryptography required for each specified cryptographic use: [Assignment: organization-defined types of cryptography for each specified cryptographic use].	Discussion Cryptography can be employed to support a variety of security solutions including, the protection of classified information and controlled unclassified information, the provision and implementation of digital signatures; and the enforcement of information separation when authorized individuals have the necessary clearances but lack the necessary formal access approvals. Cryptography can also be used to support random number and hash generation. Generally applicable cryptography and sindards include FIPS-validated cryptography and NSA-approved cryptography. For example, organizations that need to protect classified information may specify the use of NSA-approved cryptography. Organizations that need to provision and implement digital signatures may specify the use of FIPS-validated cryptography. Cryptography is implemented in accordance with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines. SC-15		System and Communications Protection Collaborative Computing Devices and Applications		a. Prohibit remote activation of collaborative computing devices and applications with the following exceptions: [Assignment: organization-defined exceptions where remote activation is to be allowed]; and b. Provide an explicit indication of use to users physically present at the devices.	applications, networked white boards, cameras, and microphones. Explicit indication of use includes signals to users when collaborative computing devices and applications are activated.	AC-21, SC-42	
SC-15 (1)	2	System and Communications Protection Collaborative Computing Devices and Applications Physical or Logical Disconnect		Provide (Selection (ane or mare): physical; lagical] disconnect of collaborative computing devices in a manner that supports ease of use.	Failing to disconnect from collaborative computing devices can result in subsequent compromises of organizational information. Providing easy methods to disconnect from such devices after a collaborative computing session ensures that participants carry out the disconnect activity without having to go through complex and tedious procedures.		
SC-15 (2)	2	System and Communications Protection Collaborative Computing Devices and Applications Blocking Inbound and Outbound Communications Traffic	Х				[Withdrawn: Incorporated into SC-7]
SC-15 (3)		System and Communications Protection Collaborative Computing Devices and Applications Disabling and Removal in Secure Work Areas		Disable or remove collaborative computing devices and applications from [Assignment: organization-defined systems or system components] in [Assignment: organization-defined secure work areas].	Failing to disable or remove collaborative computing devices and applications from systems or system components can result in compromises of information, including eavesdropping on conversations. A secure work area includes a sensitive compartmented information facility (SCIP).		
SC-15 (4)	2	System and Communications Protection Collaborative Computing Devices and Applications Explicitly Indicate Current Participants		Provide an explicit indication of current participants in [Assignment: organization-defined online meetings and teleconferences].	Explicitly indicating current participants prevents unauthorized individuals from participating in collaborative computing sessions without the explicit knowledge of other participants.		
SC-16	1	System and Communications Protection Transmission of Security and Privacy Attributes		Associate [Assignment: organization-defined security and privacy attributes] with information exchanged between systems and between system components.	Security and privacy attributes can be explicitly or implicitly associated with the information contained in organizational systems or system components. Attributes are an abstraction representing the basic properties or characteristics of an entity with respect to protecting information or the management of personally identifiable information. Attributes are typically associated with internal data structures, including records, buffers, and files within the system. Security and privacy attributes are used to implement access control and information flow control policies; reflect special dissemination, management, or distribution instructions, including permitted uses of personally identifiable information; or support other aspects of the information security and privacy policies. Privacy attributes may be used independently, or in conjunction with security attributes.	AC-3, AC-4, AC-16	
SC-16 (1)	2	System and Communications Protection Transmission of Security and Privacy Attributes Integrity Verification		Verify the integrity of transmitted security and privacy attributes.	A part of verifying the integrity of transmitted information is ensuring that security and privacy attributes that are associated with such information, have not been modified in an unauthorized manner. Unauthorized modification of security or privacy attributes can result in a loss of integrity for transmitted information.	AU-10, SC-8	
SC-16 (2)		System and Communications Protection Transmission of Security and Privacy Attributes Anti- spoofing Mechanisms		implement anti-spoofing mechanisms to prevent adversaries from falsifying the security attributes indicating the successful application of the security process.	intentionally and maliciously implement an insufficient level of security within the system. The alteration of attributes leads arganizations to believe that a greater number of security functions are in place and operational than have actually been implemented.		
SC-17		System and Communications Protection Public Key Infrastructure Certificates		a. Issue public key certificates under an [Assignment: organization-defined certificate policy] or obtain public key certificates from a papproved service provider; and b. include only approved trust anchors in trust stores or certificate stores managed by the organization.	certificates related to internal operations of systems, for example, application-specific time services. In cryptographic systems with a hierarchical structure, a trust anchor is an authoritative source (i.e., a certificate authority) for which trust is assumed and not derived. A root certificate for a PKI system is an example of a trust anchor. A trust store or certificate store maintains a list of trusted root certificates.	AU-10, IA-5, SC-12	
SC-18		System and Communications Protection Mobile Code		a. Define acceptable and unacceptable mobile code and mobile code technologies; and b. Authorize, monitor, and control the use of mobile code within the system.	system. Decisions regarding the use of mobile code within organizational systems are based on the potential for the code to cause damage to the systems if used maliciously, Mobile code technologies include Java, JavaScript, Flash animations, and VSScript. Usage restrictions and implementation guidelines apply to both the selection and use of mobile code installed on servers and mobile code downloaded and executed on individual workstations and devices, including notebook computers and smart phones. Mobile code policy and procedures address specific actions taken to prevent the development, acquisition, and introduction of unacceptable mobile code within organizational systems, including requiring mobile code to be digitally signed by a trusted source.	AU-2, AU-12, CM-2, CM-6, SI-3	
SC-18 (1)	2	System and Communications Protection Mobile Code Identify Unacceptable Code and Take Corrective Actions		Identify [Assignment: organization-defined unacceptable mobile code] and take [Assignment: organization- defined corrective actions].	Corrective actions when unacceptable mobile code is detected include blocking, quarantine, or alerting administrators. Blocking includes preventing transmission of word processing files with embedded macras when such macras have been determined to be unacceptable mobile code.

SC-18 (2)	Level 2	Control Name System and Communications Protection Mobile Code Acquisition, Development, and Use	Withdrawn	Control Text Verify that the acquisition, development, and use of mobile code to be deployed in the system meets [Assignment: organization-defined mobile code requirements].	None.	Related Controls	Notes
SC-18 (3)	2	System and Communications Protection Mobile Code Prevent Downloading and Execution		Prevent the download and execution of [Assignment: organization-defined unacceptable mobile code].	None.		
SC-18 (4)	2	System and Communications Protection Mobile Code Prevent Automatic Execution		Prevent the automatic execution of mobile code in [Assignment: organization-defined software applications] and enforce [Assignment: organization-defined actions] prior to executing the code.	Actions enforced before executing mobile code include prompting users prior to opening email attachments or clicking on web links. Preventing automatic execution of mobile code includes dissoling auto execute features on system components employing portable storage devices such as Compact Disks (CDs), Digital Versatile Disks (DVDs), and Universal Serial Bus (USB) devices.		
SC-18 (5)	2	System and Communications Protection Mobile Code Allow Execution Only in Confined Environments		Allow execution of permitted mobile code only in confined virtual machine environments.	Permitting execution of mobile code only in confined virtual machine environments helps prevent the introduction of molicious code into other systems and system components.	SC-44, SI-7	
SC-19	1	System and Communications Protection Voice Over Internet Protocol	Х	Technology-specific; addressed by other controls for protocols.			[Withdrawn: Technology-specific; addressed by other controls for protocols]
SC-20	1	System and Communications Protection Secure Name/address Resolution Service (authoritative Source)		a. Provide additional data origin authentication and integrity verification artifacts along with the authoritative name resolution data the system returns in response to external name/address resolution queries; and b. Provide the means to indicate the security status of child zones and (if the child supports secure resolution services) to enable verification of a chain of trust among parent and child domains, when operating as part of a distributed, hierarchical namespace.	This control enables external clients, including remote Internet clients, to obtain origin authentication and integrity verification assurances for the hostyfe-vick name to network address resolution information obtained through the service. Systems that provide name and address resolution services include domain name system (DNS) servers. Additional arrifacts include DNS Security (DNSSEC) digital signatures and cryptographic keys. Authoritative data include DNS resource records. The means to indicate the security status of child zones include the use of delegation signer resource records in the DNS. Systems that use technologies other than the DNS to map between host and service names and network addresses provide other means to assure the authenticity and integrity of response data.	AU-10, SC-8, SC-12, SC-13, SC-21, SC-22	
SC-20 (1)	2	System and Communications Protection Secure Name/address Resolution Service (authoritative Source) Child Subspaces	Χ				[Withdrawn: Incorporated into SC-20]
SC-20 (2)	2	System and Communications Protection Secure Name/address Resolution Service (authoritative Source) Data Origin and Integrity		Provide data origin and integrity protection artifacts for internal name/address resolution queries.	None.		
SC-21	1	System and Communications Protection Secure Name/address Resolution Service (recursive or Caching Resolver)		Request and perform data origin authentication and data integrity verification on the name/address resolution responses the system receives from authoritative sources.	Each client of name resolution services either performs this validation on its own, or has authenticated channels to trusted validation providers. Systems that provide name and address resolution services for local clients include cercursive resolving or caching domain name system (DNS) servers. DNS client resolvers either perform validation of DNSSEC signatures, or clients use authenticated channels to recursive resolvers that performs such validations. Systems that use technologies other than the DNS to map between host/service names and network addresses provide some other means to enable clients to verify the authenticity and integrity of response data.	SC-20, SC-22	
SC-21 (1)	2	System and Communications Protection Secure Name/address Resolution Service (recursive or Caching Resolver) Data Origin and Integrity	Χ				[Withdrawn: Incorporated Into SC-21]
SC-22	1	System and Communications Protection Architecture and Provisioning for Name/address Resolution Service		Ensure the systems that collectively provide name/address resolution service for an organization are fault- tolerant and implement internal and external role separation.	systems that provide name and address resolution services include domain name system (DNS) servers. To eliminate single points of failure in systems and enhance redundancy, organizations employ at least two authoritative domain name system servers; one configured as the primary server and the other configured as the secondary server. Additionally, organizations typically deploy the servers in two geographically separated network subnetworks (i.e., not located in the same physical facility). For role separation, DNS servers with internal roles only process name and address resolution requests from within organizations (i.e., from internal clients). DNS servers with external roles only process name and address resolution information requests from clients external to organizations (i.e., on external networks including the internet). Organizations specify clients that can access authoritative DNS servers in certain roles, for example, by address ranges and explicit lists.	SC-2, SC-20, SC-21, SC-24	
SC-23	1	System and Communications Protection Session Authenticity		Protect the authenticity of communications sessions.	Protecting session authenticity addresses communications protection at the session, level; not at the packet level. Such protection establishes grounds for confidence at both ends of communications sessions in the ongoing identities of other parties and the validity of information transmitted. Authenticity protection includes protecting against man-in-the-middle attacks and session hijacking, and the insertion of false information into sessions.		
SC-23 (1)	2	System and Communications Protection Session Authenticity Invalidate Session Identifiers at Logout		Invalidate session identifiers upon user logout or other session termination.	Invalidating session identifiers at logout curtails the ability of adversaries from capturing and continuing to employ previously valid session IDs.		
SC-23 (2)	2	System and Communications Protection Session Authenticity User-initiated Logouts and Message Displays	Х				[Withdrawn: Incorporated into AC-12 (1)]
SC-23 (3)	2	System and Communications Protection Session Authenticity Unique System-generated Session Identifiers		Generate a unique session identifier for each session with [Assignment: organization-defined randomness requirements] and recognize only session identifiers that are system-generated.	Generating unique session identifiers curtails the ability of adversaries from reusing previously valid session IDs. Employing the concept of randomness in the generation of unique session identifiers protects against brute-force attacks to determine future session identifiers.	AC-10, SC-13	
SC-23 (4)	2	System and Communications Protection Session Authenticity Unique Session Identifiers with Randomization	Х				[Withdrawn: Incorporated into SC-23 (3)]
SC-23 (5)	2	System and Communications Protection Session Authenticity Allowed Certificate Authorities		Only allow the use of [Assignment: organization-defined certificate authorities] for verification of the establishment of protected sessions.	Reliance on certificate authorities for the establishment of secure sessions includes the use of Transport Layer Security (TLS) certificates. These certificates, after verification by their respective certificate authorities, facilitate the establishment of protected sessions between web clients and web servers.		
SC-24	1	System and Communications Protection Fail in Known State		Fail to a [Assignment: organization-defined known system state] for the following failures on the indicated components while preserving [Assignment: organization-defined system state information] in failure: [Assignment: list of organization-defined types of system failures on organization-defined system components].		CP-2, CP-4, CP-10, CP- 12, SA-8, SC-7, SC-22, SI-13	

Control ID	Level	Control Name Wit	ithdrawn	Control Text	Discussion	Related Controls	Notes
SC-25		System and Communications Protection Thin Nodes		Employ minimal functionality and information storage on the following system components: [Assignment: organization-defined system components].	The deployment of system components with minimal functionality reduces the need to secure every endpoint, and may reduce the exposure of information, systems, and services to attacks. Reduced or minimal functionality includes diskless nodes and thin client technologies.	SC-30, SC-44	
SC-26	1	System and Communications Protection Decoys		include components within organizational systems specifically designed to be the target of malicious attacks for detecting, deflecting, and analyzing such attacks.		RA-5, SC-30, SC-35, SC-44, SI-3, SI-4	
SC-26 (1)	2	System and Communications Protection Decoys Detection of Malicious Code	Х				[Withdrawn: Incorporated into SC-35]
SC-27	1	System and Communications Protection Platform- independent Applications		include within organizational systems, the following platform independent applications: [Assignment: organization-defined platform-independent applications].	Platforms are combinations of hardware, firmware, and software components used to execute software applications. Platforms include operating systems; the underlying computer architectures; or both. Platform-independent applications are applications with the capability to execute on multiple platforms. Such applications promote portability and reconstitution on different platforms. Application portability and the ability to reconstitute on different platforms increases the availability of mission essential functions within organizations in situations where systems with specific operating systems are under attack.	SC-29	
SC-28	1	System and Communications Protection Protection of Information at Rest		Protect the [Selection (one or more): confidentiality; integrity] of the following information at rest: [Assignment: organization-defined information at rest].	and is located on system components. Such components include internal or external hard disk drives, storage area network devices, or databases. However, the focus of protecting information at rest is not on the type of storage device or frequency of access but rather the state of the information. Information at rest addresses the confidentiality and integrity	AC-3, AC-4, AC-6, AC- 19, CA-7, CM-3, CM- S, CM-6, CP-9, MP-4, MP-5, PE-3, SC-8, SC- 12, SC-13, SC-34, SI-3, SI-7, SI-16	
SC-28 (1)	2	System and Communications Protection Protection of Information at Rest Cryptographic Protection		Implement cryptographic mechanisms to prevent unauthorized disclosure and modification of the following information at rest on [Assignment: organization-defined system components or media]: [Assignment: organization-defined information].	Selection of cryptographic mechanisms is based on the need to protect the confidentiality and integrity of organisational information. The strength of mechanism is commensurate with the security category or classification of the information. Organizations have the flexibility to encrypt information on system components or media or encrypt data structures, including files, records, or felds. Organizations using cryptographic mechanisms also consider cryptographic key management solutions (see SC-12 and SC-13).	AC-19	
SC-28 (2)	2	System and Communications Protection Protection of Information at Rest Off-line Storage		Remove the following information from online storage and store off-line in a secure location: [Assignment: organization-defined information].	Removing organizational information from online storage to off-line storage eliminates the possibility of individuals gaining unauthorized access to the information through a network. Therefore, organizations may choose to move information to off-line storage in lieu of protecting such information in online storage.		
SC-28 (3)	2	System and Communications Protection Protection of Information at Rest Cryptographic Keys		Provide protected storage for cryptographic keys [Selection: [Assignment: organization-defined safeguards] ; hardware-protected key store].	A Trusted Platform Module (TPM) is an example of a hardware-projected data store that can be used to protect cryptographic keys	SC-13	
SC-29	1	System and Communications Protection Heterogeneity		Employ a diverse set of information technologies for the following system components in the implementation of the system: [Assignment: organization-defined system components].	Increasing the diversity of information technologies within organizational systems reduces the impact of potential exploitations or compromises of specific technologies. Such diversity protects against common mode failures, including those failures induced by supply chain attacks. Diversity in information technologies also reduces the likelihood that the means adversaries use to compromise one system component will be effective against other system components, thus further increasing the adversary work factor to successfully complete planned attacks. An increase in diversity may add complexity and management overhead that could ultimately lead to mistakes and unauthorized configurations.		
SC-29 (1)	2	System and Communications Protection Heterogeneity Virtualization Techniques		Employ virtualization techniques to support the deployment of a diversity of operating systems and applications that are changed [Assignment: organization-defined frequency].	While frequent changes to operating systems and applications can pose significant configuration management challenges, the changes can result in an increased work factor for adversaries to conduct successful attacks. Changing virtual operating systems or applications, as opposed to changing actual operating systems or applications, provides wirtual changes that impede attacker success while reducing configuration management efforts. Virtualization techniques can assist in isolating untrustworthy software or software of dubious provenance into confined execution environments.		
SC-30	1	System and Communications Protection Concealment and Misdirection		Employ the following concealment and misdirection techniques for [Assignment: organization-defined systems] at [Assignment: organization-defined time-periods] to confuse and mislead adversaries; [Assignment: organization-defined concealment and misdirection techniques].		AC-6, SC-25, SC-26, SC-29, SC-44, SI-14	
SC-30 (1)	2	System and Communications Protection Concealment and Misdirection Virtualization Techniques	Х				[Withdrawn: Incorporated into SC-29 (1)]
SC-30 (2)	2	System and Communications Protection Conceolment and Misdirection Randomness		Employ [Assignment: organization-defined techniques] to introduce randomness into organizational operations and assets.	Randomness introduces increased levels of uncertainty for adversaries regarding the actions organizations take in defending their systems against attacks. Such actions may impede the ability of adversaries to correctly traget information resources of organizations supporting critical missions or business functions. Uncertainty may also cause adversaries to hesitate before initiating attacks or continuing the attacks. Misdirection techniques involving randomness include performing certain routine actions at different times of day, employing different information technologies, using different suppliers, and rotating roles and responsibilities of organizational personnel.

SC-30 (3)	2	Control Name Withdrawn System and Communications Protection Concealment and Misdirection Change Processing and Storage Locations	Control Text (Selection: [Assignment: organization-defined processing and/or storage] [Selection: [Assignment: organization-defined time frequency] ; at random time intervals].	Discussion: Adversaries target critical missions and business functions and the systems supporting those missions and functions while at the same time, trying to minimize exposure of their existence and tradecroft. The static, homogeneous, and adeterministic nature of aronaizational systems tracequed by odversaries, make such systems more susceptible to	Related Controls	Notes
			; at rondom ame intervalsji.	organizational systems trageted by awersairies, more such systems more susceptible to attacks with less adversary cost and effort to be successful. Chonging processing and storage locations (also referred to as moving target defense) addresses the advanced persistent threat using techniques such as virtualization, distributed processing, and replication. This enables organizations to relocate the system components (i.e., processing and/or storage) supporting critical missions and business functions. Changing the locations of processing activities and/or storage sites introduces a degree of uncertainty into the targeting activities by adversaries. The targeting uncertainty increases the work factor of adversaries making compromises or breaches to organizational systems more difficult and time-consuming. It also increases the chances that adversaries may inadvertently disclose aspects of tradecraft while attempting to locate critical organizational resources.		
SC-30 (4)	2	System and Communications Protection	Employ realistic, but misleading information in [Assignment: organization-defined system components] about its	This control an honcement is intended to micland notantial adversaries regarding the nature	SC-26	
3C-3U (4)	2	System fun Communications Protection (Concealment and Misdirection Misleading Information	emply revisal, our inseluing injurnation in (Assignment, Organization-regime) system components) about its security state or posture.	Into Control Entimeterins Is Interneur un insecur potential ruwers since syequing the internet and extent of controls deployed by organizations. Thus, adversaries may employ incorrect and ineffective, attack techniques. One technique for misleading adversaries is for organizations to place misleading information reagarding the specific controls deployed in external systems that are known to be targeted by adversaries. Another technique is the use of deception nest that minic actual aspects of organizational systems but use, for example, out-of-date software configurations.	31-20	
SC-30 (5)	2	System and Communications Protection Concealment and Misdirection Concealment of System Components	Employ the following techniques to hide or conceal [Assignment: organization-defined system components]: [Assignment: organization-defined techniques].	By hiding, disguishing, or concealing critical system components, organizations may be able to decrease the probability that adversaries target and successfully compromise those assets. Potential means to hide, disguise, or conceal system components include configuration of routers or the use of encryption or virtualization techniques.		
SC-31	1	System and Communications Protection Covert Channel Analysis	a. Perform a covert channel analysis to identify those aspects of communications within the system that are potential avenues for covert [Selection (one or more): storage; timing] channels; and b. Estimate the maximum bandwidth of those channels.	Developers are in the best position to identify potential areas within systems that might lead to covert channels. Covert channel analysis is a meanignful activity when there is the potential for unauthorized information flows across security domains, for example, in the case of systems containing export-controlled information and having connections to external networks (i.e., networks that are not controlled by organizations). Covert channel analysis is also useful for multilevel secure systems, multiple security level systems, and cross-domain systems.	AC-3, AC-4, SA-8, SI- 11	
SC-31 (1)	2	System and Communications Protection Covert Channel Analysis Test Covert Channels for Exploitability	Test a subset of the identified covert channels to determine the channels that are exploitable.	None.		
SC-31 (2)	2	System and Communications Protection Covert Channel Analysis Maximum Bandwidth	Reduce the maximum bandwidth for identified covert [Selection (one or more): storage; timing] channels to [Assignment: organization-defined values].	The complete elimination of covert channels, especially covert timing channels, is usually		
SC-31 (3)	2	Channel Analysis Maximum Barawian System and Communications Protection Covert Channel Analysis Measure Bandwidth in Operational Environments	[Assignmen: organization-asjined values]. Measure the bandwidth of [Assignment: organization-defined subset of identified covert channels] in the operational environment of the system.	not possible without significant performance impacts. Measuring cover channel bandwidth in specified operational environments helps organizations to determine how much information can be covertly leaked before such leakage adversely affects missions or business functions. Covert channel bandwidth may be significantly different when measured in those settings that ore independent of the specific environments of operation, including laboratories or system development environments.		
SC-32	1	System and Communications Protection System Partitioning	Partition the system into [Assignment: organization-defined system components] residing in separate [Selection physical; logical] domains or environments based on [Assignment: organization-defined circumstances for physical or logical separation of components].	System partitioning is a part of a defense-in-depth protection strategy. Organizations determine the degree of physical separation of system components. Physical separation options include: physically distinct components in separate racks in the same room; critical components in separate rooms; and geographical separation of the most critical components. Security categorization can guide the selection of appropriate candidates for domain partitioning. Managed interfaces restrict or prohibit network access and information flow among partitioned system components.	AC-4, AC-6, SA-8, SC- 2, SC-3, SC-7, SC-36	
SC-32 (1)	2	System and Communications Protection System Partitioning Separate Physical Domains for Privileged Functions	Partition privileged functions into separate physical domains.	Privileged functions operating in a single physical domain may represent a single point of failure if that domain becomes compromised or experiences a denial of service.		
SC-33	1	System and Communications Protection X Transmission Preparation Integrity				[Withdrawn: Incorporated into SC-8]
SC-34		System and Communications Protection Non-modifiable Executable Programs	For [Assignment: organization-defined system components], load and execute: a. The operating environment from hardware-enforced, read-only media; and b. The following applications from hardware-enforced, read-only media: [Assignment: organization-defined applications].	The operating environment for a system contains the code that hosts applications, including operating systems, executives, or virtual machine monitors (i.e., hypervisors). It can also include certain applications running directly on hardware platforms. Hardware-enforced, read-only media include Compact Disk-Recordable (ICD-R) and Digital Versatile Disk-Recordable (DF-R) disk drives and one-time programmable read-only memory. The use of non-modifiable storage ensures the integrity of software from the point of creation of the read-only image. Use of reprogrammable read-only memory can be accepted as read-only media provided integrity can be adequately protected from the point of initial writing to the insertion of the memory into the system; and there are reliable hardware protections against reprogramming the memory while installed in organizational systems.		
SC-34 (1)	2	System and Communications Protection Non- modifiable Executable Programs No Writable Storage	Employ (Assignment: organization-defined system components) with no writeable storage that is persistent across component restart or power an/aff.	Disallowing writeable storage eliminates the possibility of malicious code insertion via persistent, writeable storage within the designated system components. The restriction applies to fixed and removable storage, with the latter being addressed either directly or as specific restrictions imposed through access controls for mobile devices.	AC-19, MP-7	
SC-34 (2)	2	System and Communications Protection Non- modifiable Executable Programs Integrity Protection on Read-only Media	Protect the integrity of information prior to storage on read-only media and control the media after such information has been recorded onto the media.	Controls prevent the substitution of media into systems or the reprogramming of programmable read-only media prior to installation into the systems. Integrity protection controls include a combination of prevention, detection, and response.	CM-3, CM-5, CM-9, MP-2, MP-4, MP-5, SC-28, SI-3	
SC-34 (3)	2	System and Communications Protection Non- modifiabile Executable Programs Hardware-based Protection	(a) Employ hardware-based, write-protect for [Assignment: organization-defined system firmware components]; and (b) Implement specific procedures for [Assignment: organization-defined authorized individuals] to manually disable hardware write-protect for firmware modifications and re-enable the write-protect prior to returning to operational mode.		·	
SC-35	1	System and Communications Protection External Malicious Code Identification	Include system components that proactively seek to identify network-based malicious code or malicious websites.	External malicious code identification differs from decoys in SC-26 in that the components actively probe networks, including the internet, in search of malicious code contained on external websites. Like decoys, the use of external malicious code identification techniques requires some supporting isolation measures to ensure that any malicious code discovered during the search and subsequently executed does not infect organizational systems. Virtualization is a common technique for achieving such isolation.	SC-26, SC-44, SI-3, SI- 4	

Control ID	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls No	ntes
SC-36	1	System and Communications Protection Distributed	Distribute the following processing and storage components across multiple [Selection: physical locations; logical	Distributing processing and storage across multiple physical locations or logical domains	CP-6, CP-7, PL-8, SC-	
		Processing and Storage	domains]: [Assignment: organization-defined processing and storage components].	provides a degree of redundancy or overlap for organizations. The redundancy and overlap		
l				increases the work factor of adversaries to adversely impact organizational operations,		
l				assets, and individuals. The use of distributed processing and storage does not assume a		
l				single primary processing or storage location. Therefore, it allows for parallel processing		
				and storage.		
SC-36 (1)	2	System and Communications Protection Distributed	(a) Employ polling techniques to identify potential faults, errors, or compromises to the following processing and		SI-4	
		Processing and Storage Polling Techniques	storage components: [Assignment: organization-defined distributed processing and storage components]; and	to compromise the confidentiality, integrity, or availability of organizational information		
			(b) Take the following actions in response to identified faults, errors, or compromises: [Assignment: organization-			
			defined actions].	prevent adversaries from compromising one or more of the components. Polling compares		
				the processing results and/or storage content from the distributed components and		
				subsequently votes on the outcomes. Polling identifies potential faults, compromises, or		
				errors in the distributed processing and storage components. Polling techniques may also		
				be applied to processing and storage components that are not physically distributed.		
SC-36 (2)	2		Synchronize the following duplicate systems or system components: [Assignment: organization-defined duplicate		CP-9

l				of government issued priotographic racinification as a condition of receipt.		
SC-38	1	System and Communications Protection Operations	Employ the following operations security controls to protect key organizational information throughout the	Operations security (OPSEC) is a systematic process by which potential adversaries can be	CA-2, CA-7, PL-1, PM-	
		Security	system development life cycle: [Assignment: organization-defined operations security controls].	denied information about the capabilities and intentions of organizations by identifying,	9, PM-12, RA-2, RA-3,	
		,	7,	controlling, and protecting generally unclassified information that specifically relates to the	RA-5, SC-7, SR-3, SR-	
				planning and execution of sensitive organizational activities. The OPSEC process involves	7	
				five steps: identification of critical information: analysis of threats: analysis of		
				vulnerabilities; assessment of risks; and the application of appropriate countermeasures.		
				OPSEC controls are applied to organizational systems and the environments in which those		
				systems operate. OPSEC controls protect the confidentiality of information, including		
				limiting the sharing of information with suppliers and potential suppliers of system		
				components and services, and with other non-organizational elements and individuals.		
				Information critical to organizational missions and business functions includes user		
				identities, element uses, suppliers, supply chain processes, functional requirements,		
				security requirements, system design specifications, testing and evaluation protocols, and		
				security control implementation details.		
SC-39	1	System and Communications Protection Process	Maintain a separate execution domain for each executing system process.	Systems can maintain separate execution domains for each executing process by assigning	AC-3, AC-4, AC-6, AC-	
l		Isolation		each process a separate address space. Each system process has a distinct address space so	25, SA-8, SC-2, SC-3,	
l				that communication between processes is performed in a manner controlled through the		
l				security functions, and one process cannot modify the executing code of another process.		
l				Maintaining separate execution domains for executing processes can be achieved, for		
l				example, by implementing separate address spaces, Process isolation technologies.		
I I				including sandboxing or virtualization, logically separate software and firmware from other		
I I				software, firmware, and data. Process isolation helps limit the access of potentially		
I I				untrusted software to other system resources. The capability to maintain separate		
I I				execution domains is available in commercial operating systems that employ multi-state		
				processor technologies.		
SC-39 (1)	2	System and Communications Protection Process	Implement hardware separation mechanisms to facilitate process isolation.	Hardware-based separation of system processes is generally less susceptible to compromise		
		Isolation Hardware Separation		than software-based separation, thus providing greater assurance that the separation will		
				be enforced. Hardware separation mechanisms include hardware memory management.		
SC-39 (2)	2	System and Communications Protection Process	Maintain a separate execution domain for each thread in [Assignment: organization-defined multi-threaded	None.		·
		Isolation Separate Execution Domain Per Thread	processing].			
SC-40	1	System and Communications Protection Wireless	Protect external and internal [Assignment: organization-defined wireless links] from the following signal	Wireless link protection applies to internal and external wireless communication links that	AC-18, SC-5	
		Link Protection	parameter attacks: [Assignment: organization-defined types of signal parameter attacks or references to sources			
			for such attacks].	the signal parameters of wireless links if such links are not adequately protected. There are		
				many ways to exploit the signal parameters of wireless links to gain intelligence, deny		
				service, or spoof system users. Protection of wireless links reduces the impact of attacks		
				that are unique to wireless systems. If organizations rely on commercial service providers		
				for transmission services as commodity items rather than as fully dedicated services, it may		
				not be possible to implement this control.		
SC-40 (1)	2	System and Communications Protection Wireless	Implement cryptographic mechanisms that achieve [Assignment: organization-defined level of protection]	Implementation of cryptographic mechanisms for electromagnetic interference protects	PE-21, SC-12, SC-13	
		Link Protection Electromagnetic Interference	against the effects of intentional electromagnetic interference.	against intentional jamming that might deny or impair communications by ensuring that		
				wireless spread spectrum waveforms used to provide anti-jam protection are not		
				predictable by unauthorized individuals. The implementation of cryptographic mechanisms		
				may also coincidentally mitigate the effects of unintentional jamming due to interference		
				from legitimate transmitters sharing the same spectrum. Mission requirements, projected		
ı				threats, concept of operations, and applicable laws, executive orders, directives,		
				regulations, policies, and standards determine levels of wireless link availability,		
				cryptography needed, or performance.		

Control ID	Lough	Control Name	Control Tout	Discussion	Related Centrals	Natos
5C-40 (2)	2	Control Name Withdrawn System and Communications Protection Wireless Link Protection Reduce Detection Potential	Control text Implement cryptographic mechanisms to reduce the detection potential of wireless links to [Assignment: organization-defined level of reduction].	covert communications and to protect wireless transmitters from geo-location. It also ensures that spread spectrum waveforms used to achieve low probability of detection are not predictable by nouthorized individuals. Mission requirements, projected threats, cancept of operations, and applicable lows, executive orders, directives, regulations, policies, and standards determine the levels to which wireless links are undetectable.	Related Controls SC-12, SC-13	Notes -
SC-40 (3)	2	System and Communications Protection Wireless Link Protection Imitative or Manipulative Communications Deception	Implement cryptographic mechanisms to identify and reject wiveless transmissions that are deliberate attempts to achieve imitative or manipulative communications deception based on signal parameters.	Implementation of cryptographic mechanisms to identify and reject imitative or manipulative communications ensures that the signal parameters of wireless transmissions are not predictable by unauthorized individuals. Such unpredictability reduces the probability of imitative or manipulative communications deception based upon signal parameters alone.	SC-12, SC-13, SI-4	
SC-40 (4)	2	System and Communications Protection Wireless Link Protection Signal Parameter Identification	Implement cryptographic mechanisms to prevent the identification of [Assignment: organization-defined wireless transmitters] by using the transmitter signal parameters.	Radio fingerprinting techniques identify the unique signal parameters of transmitters to fingerprint such transmitters for purposes of tracking and mission or user identification. Implementation of cytoptarophic mechanisms to prevent the identification of wireless transmitters protects against the unique identification of wireless transmitters for purposes of intelligence exploitation by examing that anti-fingerprinting alterations to signal parameters are not predictable by unauthorized individuals. It also provides anonymity when required.	SC-12, SC-13	
SC-41		System and Communications Protection Port and I/O Device Access	[Selection: Physically, Logically] disable or remove [Assignment: organization-defined connection ports or input/output devices] on the following systems or system components: [Assignment: organization-defined systems or system components].	Input/Output (I/O) devices include Compact Disk (CD) and Digital Versatile Disk (IVO) drives. Disabling or removing such connection ports and I/O devices helps prevent exfiltration of information from systems and the introduction of malicious code into systems from those ports or devices. Physically disabling or removing ports and/or devices is the stronger action.	AC-20, MP-7	
SC-42	1	System and Communications Protection Sensor Capability and Data	a. Prohibit the remote activation of environmental sensing capabilities on organizational systems or system components with the following exceptions: [Assignment: organization-defined exceptions where remote activation of sensors is allowed]; and b. Provide an explicit indication of sensor use to [Assignment: organization-defined class of users].	Sensor capability and data applies to types of systems or system components characterized as mobile devices, for example, smart phones and tablets. Mobile devices often include sensors that can collect and record data regarding the environment where the system is in use. Sensors that are embedded within mobile devices include cameras, microphones, Global Positioning System (GPS) mechanisms, and accelerometers. While the sensors on mobiles devices provide an important function, if activated covertly such devices can potentially provide a means for adversaries to learn valuable information about individuals and organizations. For example, remotely activating the GPS function on a mobile device could provide an adversary with the ability to track the specific movements of an individual.	SC-15	
SC-42 (1)	2	System and Communications Protection Sensor Capability and Data Reporting to Authorized Individuals or Roles	Verify that the system is configured so that data or information collected by the [Assignment: organization-defined sensors] is only reported to authorized individuals or roles.	In situations where sensors are activated by authorized individuals, it is still possible that the data or information collected by the sensors will be sent to unauthorized entities.		
SC-42 (2)	2	System and Communications Protection Sensor Capability and Data Authorized Use	Employ the following measures so that data or information collected by [Assignment: organization-defined sensors] is only used for authorized purposes: [Assignment: organization-defined measures].	Information collected by sensors for a specific authorized purpose could be misused for some unauthorized purpose. For example, GFS sensors that are used to support traffic novigation could be misused to track movements of individuals. Measures to mitigate such activities include additional training to ensure that authorized individuals do not abuse their authority; and in the case where sensor data or informations in smintained by external parties, contractual restrictions on the use of such data or information.	PT-2	
SC-42 (3)	2	System and Communications Protection Sensor Capability and Data Prohibit Use of Devices	Prohibit the use of devices possessing [Assignment: organization-defined environmental sensing capabilities] in [Assignment: organization-defined facilities, areas, or systems].	For example, organizations may prohibit individuals from bringing cell phones or digital cameras into certain designated facilities or controlled areas within facilities where classified information is stored or sensitive conversations are taking place.		
SC-42 (4)		System and Communications Protection Sensor Capability and Data Notice of Collection	Employ the following measures to facilitate an individual's awareness that personally identificable information is being collected by [Assignment: organization-defined sensors]: [Assignment: organization-defined measures].	effectively engage in managing their privacy. Measures can include conventional written notices and sensor configurations that make individuals aware directly or indirectly through other devices that the sensor is collecting information. Usability and efficacy of the notice are important considerations.	PT-1, PT-5, PT-6	
SC-42 (5)	2	System and Communications Protection Sensor Capability and Data Collection Minimization	Employ (Assignment: organization-defined sensors) that are configured to minimize the collection of information about individuals that is not needed.	Although policies to control for authorized use can be applied to information once it is callected, minimizing the callection of information that is not needed miligates privacy risk at the system entry point and mitigates the risk of policy control failures. Sensor configurations include the obscuring of human features such as blurring or pixelating flesh tones.	SI-12	
SC-43	1	System and Communications Protection Usage Restrictions	Establish usage restrictions and implementation guidelines for the following system components: [Assignment: organization-defined system components]; and b. Authorize, monitor, and control the use of such components within the system.	code, mobile devices, wireless access, and wired and wireless peripheral components (e.g., copiers, printers, scanners, optical devices, and other similar technologies). The usage restrictions and implementation guidelines are based on the potential for system components to cause damage to the system and help to ensure that only authorized system use occurs.		
SC-44	1	System and Communications Protection Detonation Chambers	Employ a detonation chamber capability within [Assignment: organization-defined system, system component, or location].	Detonation chambers, also known as dynamic execution environments, allow organizations to open email attachments, execute untrusted or suspicious applications, and execute Universal Resource Locator requests in the safety of an isolated environment or a virtualized sandbox. These protected and isolated execution environments provide a means of determining whether the associated attachments or applications contain malicious code. While related to the concept of deception nets, this control is not intended to maintain a long-term environment in which adversaries can operate and their actions can be observed. Rather, it is intended to quickly identify malicious code and either reduce the likelihood that the code is propagated to user environments of operation or prevent such propagation completely.	SC-7, SC-25, SC-26, SC-30, SC-35, SC-39, SI-3, SI-7	
SC-45	1	System and Communications Protection System Time Synchronization	Synchronize system clocks within and between systems and system components.	Time synchronization of system clocks is essential for the correct execution of many system services, including identification and authentication processes involving certificates and time-of-day restrictions as part of access control. Denial-of-service or failure to deny expired credentials may result without properly synchronized clocks within and between systems and system components. Time is commonly expressed in Coordinated Universal Time (UTC), a modern continuation of Greenwich Mean Time (GMT), or local time with an offset from UTC. The granularity of time measurements refers to the degree of synchronization between system clocks and reference clocks, for example, clocks synchronizing within hundreds of milliseconds or tens of milliseconds. Organizations may define different time granularities for system components. Time service can be critical to other security capabilities such as access control and identification and authentication, depending on the nature of the mechanisms used to support the capabilities.	AC-3, AU-8, IA-2, IA-8

SC-51	1	System and Communications Protection Operational and Internet-based Technologies	a. Implement the following controls on [Assignment: organization-defined Operational Technology (OT),	Operational Technology (OT) is the hardware, software, and firmware components of a system used to detect or cause changes in physical processes through the direct control and monitoring of	2. SC-3. SC-49	
		Operational and Internet-based Technologies	Internet of Things (IoT), and/or Industrial Internet of Things (IIoT) systems, components, or devices] prior to connecting to [Assignment: organization-defined systems or networks]: [Assignment: organization-defined	physical devices. Examples include distributed control systems (DCS), supervisory control and data	2, SC-3, SC-49	
			connecting to [Assignment: organization-defined systems or networks]: [Assignment: organization-defined controls]: or	acquisition (SCADA) systems, and programmable logic controllers (PLC). The term operational		
			b. Isolate the OT, IoT, and IIoT systems, components, or devices from the designated organizational systems or	technology is used to demonstrate the differences between industrial control systems (ICS) that are		
			prohibit network connectivity by the systems, components, or devices from the designated organizational systems or	typically found in manufacturing and power plants and the information technology (IT) systems that		
			prombit network connectivity by the systems, components, or devices.	typically support traditional data processing applications. The term Internet of Things (IoT) is used to		
				describe the network of devices (e.g., vehicles, medical devices, wearables, and home appliances)		
				that contain the hardware, software, firmware, and actuators which allow the devices to connect,		
				interact, and exchange data and information. IoT extends Internet connectivity beyond workstations,		
				notebook computers, smartphones and tablets to physical devices that do not typically have such		
				connectivity. IoT devices can communicate and interact over the Internet, and they can be remotely monitored and controlled. Finally, the term Industrial Internet of Things (IIoT) is used to describe the		
				sensors, instruments, machines, and other devices that are networked together and use Internet		
				connectivity to enhance industrial and manufacturing business processes and applications.		
	1			The recent convergence of IT and OT, producing cyber-physical systems, increases the attack surface		
	1			of organizations significantly and provides attack vectors that are challenging to address.		
				Unfortunately, most of the current generation of IoT, OT and IIOT devices are not designed with		
				security as a foundational property. Connections to and from such devices are generally not		
				encrypted, do not provide the necessary authentication, are not monitored, and are not logged. As a		
				result, these devices pose a significant cyber threat. In some instances, gaps in IoT, OT, and IIoT		
				security capabilities may be addressed by employing intermediary devices that can provide		
				encryption, authentication, security scanning, and logging capabilities, and preclude the devices		
	1			from being accessible from the Internet. But such mitigating options are not always available. The		
	1			situation is further complicated because some of the IoT/OT/IIoT devices are needed for essential missions and functions. In those instances, it is necessary that such devices are isolated from the		
				Internet to reduce the susceptibility to hostile cyber-attacks.

			period) of the release of the updates; and		SI-7, SI-11	
			d. Incorporate flaw remediation into the organizational configuration management process.	flaws discovered during assessments, continuous monitoring, incident response activities,	517,5111	
				and system error handling. By incorporating flaw remediation into configuration		
				management processes, required remediation actions can be tracked and verified.		
				Organization-defined time-periods for updating security-relevant software and firmware		
				may vary based on a variety of risk factors, including the security category of the system or		
				the criticality of the update (i.e., severity of the vulnerability related to the discovered flaw);		
				the organizational mission; or the threat environment. Some types of flaw remediation may		
				require more testing than other types. Organizations determine the type of testing needed		
				for the specific type of flaw remediation activity under consideration and the types of		
				changes that are to be configuration-managed. In some situations, organizations may		
				determine that the testing of software or firmware updates is not necessary or practical, for		
				example, when implementing simple malicious code signature updates. Organizations		
				consider in testing decisions whether security-relevant software or firmware updates are		
				obtained from authorized sources with appropriate digital signatures.

Control ID	Lovel	Control Name	Control Tout	Discussion	Related Controls	Notes
SI-3 (8)	2	Control Name Withdrawn System and Information Integrity Malicious Code Protection Detect Unauthorized Commands	Control Text (a) Detect the following unauthorized operating system commands through the kernel application programming interface on [Assignment: organization-defined system hardware components]: [Assignment: organization-defined unauthorized operating system commands]; and (b) [Selection (one or more): issue a warning; audit the command execution; prevent the execution of the command].	Detecting unauthorized commands can be applied to critical interfaces other than kernel- based interfaces, including interfaces with virtual machines and privileged applications. Unauthorized operating system commands include commands for kernel functions from system processes that are not trusted to initiate such commands, or commands for kernel functions that are suspicious even though commands of that type are reasonable for processes to initiate. Organizations can define the malicious commands to be detected by a combination of command types, command classes, or specific instances of commands.	Related Controls AU-2, AU-6, AU-12	The control of the co
SI-3 (9)	2	System and Information Integrity Malicious Code	Implement [Assignment: organization-defined mechanisms] to authenticate [Assignment: organization-defined	Organizations can also define hardware components by component type, component, component location in the network, or combination therein. Organizations may select different actions for different types, classes, or instances of malicious commands. This control enhancement protects against unauthorized remote commands and the replay	SC-12, SC-13, SC-23	
		Protection Authenticate Remote Commands	remote commands].	of outhorized commands. This capability is important for those remote systems whose loss, malfunction, mislinection, are soliculation would have immediate and/or serious consequences, including, for example, injury or death, property damage, loss of high-value sseets; compranise of classified or controlled unclossified information, or follure of missions or business functions. Authentication safeguards for remote commands ensure that systems accept and execute commands in the order intended, execute only authorized commands, and reject unauthorized commands. Cyptographic mechanisms can be employed, for example, to authenticate remote commands.		
SI-3 (10)	2	System and Information Integrity Malicious Code Protection Malicious Code Analysis	(a) Employ the following tooks and techniques to analyze the characteristics and behavior of malicious code: [Assignmen: organization-defined tools and techniques]; and (b) Incorporate the results from malicious code analysis into organizational incident response and flaw remediation processes.	The use of malicious code analysis tools provides organizations with a more in-depth understanding of adversory tradecraft (i.e., tackis, techniques, and procedures) and the functionality and purpose of specific instances of malicious code. Understanding the characteristics of malicious code facilitates effective organizational responses to current and future threats. Organizations can conduct malicious code analyses by employing reverse engineering techniques or by monitoring the behavior of executing code.		
S1-4	1	System and Information Integrity System Monitoring	A. Monitor the system to detect: 1. Attacks and indicators of potential attacks in accordance with the following monitoring objectives: [Assignment: organization-defined monitoring objectives], and 2. Unauthorized local, network, and remote connections; b. Identify unauthorized use of the system through the following techniques and methods: [Assignment: organization-defined techniques and methods]: c. Invoke internal monitoring capabilities or deploy monitoring devices: 1. Strategically within the system to collect organization-determined essential information; and 2. At ad no locations within the system to track specific types of transactions of interest to the organization; d. Protect information obtained from intrusion-monitoring tools from unauthorized access, modification, and deletion; e. Adjust the level of system monitoring activity when there is a change in risk to organizational operations and assets; individuals, other organizations, or the Nation; f. Obtain legal opinion regarding system monitoring activities; and g. Provide [Assignment: organization-defined system monitoring information] to [Assignment: organization-defined personnel or roles] [Selection (one or more): as needed; [Assignment: organization-defined frequency]]	audit activities in real time or by observing other system aspects such as access patterns, characteristics of access, and other actions. The monitoring objectives guide and inform the determination of the events. System monitoring capability is achieved through a variety of tools and techniques, including intrusion detection and prevention systems, malicious code protection software, scanning tools, audit record monitoring software, and network monitoring software. Depending on the security architecture implementation, the distribution and configuration of monitoring devices may impact throughput at key internal and external boundaries, and at other locations across an entwork due to the introduction of network throughput latency. If throughput management is needed, such devices are strategically located and deployed as part of an established organization-wide security architecture. Strategic locations for monitoring devices include selected perimeter locations and near key servers and server farms supporting critical applications. Monitoring devices are typically employed at the managed interfaces associated with controls SC-7 and AC-17. The information collected is a function of the organization-wild monitoring objectives and	CM-11, IA-10, IR-4, MA-3, MA-4, PM-12, RA-5, SC-5, SC-7, SC- IS, SC-26, SC-31, SC- 35, SC-36, SC-37, SC- 43, SI-3, SI-6, SI-7, SR 9, SR-10	
SI-4 (1)	2	System and Information Integrity System Monitoring System-wide Intrusion Detection System	Connect and configure individual intrusion detection tools into a system-wide intrusion detection system.	Linking individual intrusion detection tools into a system-wide intrusion detection system provides additional coverage and effective detection capability. The information contained in one intrusion detection tool can be shared widely across the organization making the system-wide detection capability more robust and powerful.		
SI-4 (2)		System and Information Integrity System Monitoring Automated Tools and Mechanisms for Real-time Analysis	Employ automated tools and mechanisms to support near real-time analysis of events.	Automated tools and mechanisms include host-based, network-based, transport-based, or storage-based event monitoring tools and mechanisms or Security Information and Event Management technologies that provide real time analysis of alerts and notifications generated by organizational systems. Automated monitoring techniques can create unintended privary risks because automated controls may connect to external or otherwise unrelated systems. The matching of records between these systems may create linkages with unintended consequence. Organizations assess and document these risks in their privacy impact assessment and make determinations that are in alignment with their privacy program plan.		
SI-4 (3)	2	System and Information Integrity System Monitoring Automated Tool and Mechanism Integration	Employ automated tools and mechanisms to integrate intrusion detection tools and mechanisms into access control and flow control mechanisms.	Using automated tools and mechanisms to integrate intrusion detection tools and mechanisms into access and flow control mechanisms facilitates a rapid response to attacks by enabling reconfiguration of mechanisms in support of attack isolation and elimination.	PM-23, PM-25	
SI-4 (4)		System and Information Integrity System Monitoring Inbound and Outbound Communications Traffic	Monitor inbound and outbound communications traffic [Assignment: organization-defined frequency] for unusual or unauthorized activities or conditions.	Unusual or unauthorized activities or conditions related to system inbound and outbound communications traffic include internal traffic that indicates the presence of malicious code within arganizational systems or propagating among system components; the unauthorized exporting of information; or signaling to external systems. Evidence of malicious code is used to identify potentially compromised systems or system components.		
SI-4 (5)		System and Information Integrity System Monitoring System-generated Alerts	Alert [Assignment: organization-defined personnel or roles] when the following system-generated indications of compromise or potential compromise occur: [Assignment: organization-defined compromise indicators].	Alerts may be generated from a variety of sources, including audit records or inputs from nollicious code protection mechanisms; intusion detection or prevention mechanisms; or boundary protection devices such as firewalls, gateways, and routers. Alerts can be automated and may be transmitted, for example, telephonically, by electronic mail messages, or by text messaging. Organizational personnel on the elect notification list can include system administrators, mission or business owners, system owners, senior agency finformation security officers, senior agency for fistor, systems executly officers, or privacy officers. This control enhancement addresses the security alerts generated by the system. Alternatively, alerts generated by organizations in SI-4(12) facus on information sources external to the system such as suspicious activity reports and reports on potential insider threats.	AU-4, AU-5, PE-6	
SI-4 (6)	2	System and Information Integrity System Monitoring X Restrict Non-privileged Users				[Withdrawn: Incorporated into AC-6 (10)]

	Lough	Control Name Wit	Control Tout	Discussion	Rolated Controls	Motor
SI-4 (7)	2	System and Information Integrity System Monitoring	(a) Notify [Assignment: organization-defined incident response personnel (identified by name and/or by role)] o	f Least-disruptive actions include initiating requests for human responses.	Related Controls	Notes
. , ,		Automated Response to Suspicious Events	detected suspicious events; and (b) Take the following actions upon detection: [Assignment: organization-defined least-disruptive actions to terminate suspicious events].			
SI-4 (8)	2	System and Information Integrity System Monitoring Protection of Monitoring Information	X			[Withdrawn: Incorporated into SI-4]
SI-4 (9)	2	System and Information Integrity System Monitoring Testing of Monitoring Tools and Mechanisms	Test intrusion-monitoring tools and mechanisms [Assignment: organization-defined frequency].	Testing intrusion-monitoring tools and mechanism is necessary to ensure that the tools and mechanisms are operating correctly and continue to satisfy the monitoring objectives of organizations. The frequency and depth of testing depends on the types of tools and mechanisms used by organizations and the methods of deployment.	CP-9	
SI-4 (10)	2	System and Information Integrity System Monitoring Visibility of Encrypted Communications	Make provisions so that [Assignment: organization-defined encrypted communications traffic] is visible to [Assignment: organization-defined system monitoring tools and mechanisms].	Organizations balance the need for encrypting communications traffic to protect data confidentiality with the need for having visibility into such traffic from a monitoring perspective. Organizations determine whether the visibility requirement applies to internal encrypted traffic, encrypted traffic intended for external destinations, or a subset of the traffic types.		
SI-4 (11)	2	System and Information Integrity System Monitoring Analyze Communications Traffic Anomalies	Analyze outbound communications traffic at the external interfaces to the system and selected [Assignment: organization-defined interior points within the system] to discover anomalies.	Organization-defined interior points include subnetworks and subsystems. Anomalies within organizational systems include large file transfers, long-time persistent connections, attempts to access information from unexpected locations, the use of unusual protocals and ports, the use of unmonitored network protocols (e.g. IPv6 usage during IPv4 transition), and attempted communications with suspected malicious external addresses.		
SI-4 (12)	2	System and Information Integrity System Monitoring Automated Organization-generated Alerts	Aler (Assignment: organization-defined personnel or roles) using (Assignment: organization-defined automate mechanisms) when the following indications of inappropriate or unusual activities with security or privacy implications occur: (Assignment: organization-defined activities that trigger alerts).	d Organizational personnel on the system alert notification list include system administrators, mission or business owners, system owners, senior agency information security officer, senior agency official for privacy, system security officers, or privacy officers. This control enhancement focuses on the security olerts generated by organizations and transmitted using automated mens. In contrast to the olerts generated by systems in Si-4(s) that focus on information sources that are internal to the systems such as audit records, the sources of information for this enhancement focus on other entitles such as suspicious activity reports and reports on potential insider threats.		
SI-4 (13)	2	System and Information Integrity System Monitoring Analyze Traffic and Event Patterns	(a) Analyze communications traffic and event patterns for the system; (b) Develop profiles representing common traffic and event patterns; and (c) Use the traffic and event profiles in tuning system-monitoring devices.	Identifying and understanding common communications traffic and event patterns helps organizations provide useful information to system monitoring devices to more effectively identify suspicious or anomalous traffic and events when they occur. Such information can help reduce the number of false positives and false negatives during system monitoring.		
SI-4 (14)	2	System and Information Integrity System Monitoring Wireless Intrusion Detection	Employ a wireless intrusion detection system to identify rogue wireless devices and to detect attack attempts and potential compromises or breaches to the system.	Wireless signals may radiate beyond organizational facilities. Organizations proactively search for unauthorized wireless connections, including the conduct of thorough scans for unauthorized wireless access points. Wireless scans are not limited to those areas within facilities containing systems, but also include areas outside of facilities to verify that unauthorized wireless access points are not connected to organizational systems.	AC-18, IA-3	
SI-4 (15)	2	System and Information Integrity System Monitoring Wireless to Wireline Communications	Employ an intrusion detection system to monitor wireless communications traffic as the traffic passes from wireless to wireline networks.	Wireless networks are inherently less secure than wired networks. For example, wireless networks are more susceptible to evesdroppers or traffic analysis than wireline networks. Employing intrusion detection systems to monitor wireless communications traffic helps to ensure that the traffic does not contain malicious code prior to transitioning to the wireline network.	AC-18	
SI-4 (16)	2	System and Information Integrity System Monitoring Carrelate Monitoring Information	Correlate information from monitoring tools and mechanisms employed throughout the system.	Correlating information from different system monitoring tools and mechanisms can provide a more comprehensive week of system activity. Correlating system monitoring tools and mechanisms that typically work in isolation, including malicious code pratection software, host monitoring, and network monitoring, can provide an organization-wide monitoring view and may reveal otherwise unseen attack patterns. Understanding capabilities and limitations of diverse monitoring tools and mechanisms and how to maximize the utility of information generated by those tools and mechanisms can help organizations to develop, operate, and maintain effective monitoring programs. Correlation of monitoring information is especially importand unting the transition from older to newer technologies (e.g., transitioning from IPv4 to IPv6 network protocols).	AU-6	
SI-4 (17)	2	System and Information Integrity System Monitoring Integrated Situational Awareness	Correlate information from monitoring physical, cyber, and supply chain activities to achieve integrated, organization-wide situational awareness.	Correlating monitoring information from a more diverse set of information sources helps to achieve integrated situational owareness. Integrated situational owareness from a combination of physical, cyber, and supply chain monitoring activities enhances the capability of organizations to more quickly detect sophisticated attacks and investigate the methods and techniques employed to carry out such attacks. In contrast to SI-416) that correlates the availous cyber anomationing information, this control enhancement correlates monitoring beyond the cyber domain. Such monitoring may help reveal attacks on organizations that are operating across multiple attack vectors.	AU-16, PE-6	
SI-4 (18)	2	System and Information Integrity System Monitoring Analyze Traffic and Covert Exfiltration	Analyze outbound communications traffic at external interfaces to the system and at the following interior points to detect covert exfiltration of information: [Assignment: organization-defined interior points within the system].	Organization-defined interior points include subnetworks and subsystems. Covert means that can be used to exfiltrate information include steganography.		
SI-4 (19)	2	System and Information Integrity System Monitoring Risk for Individuals	Implement [Assignment: organization-defined additional manitoring] of individuals who have been identified by [Assignment: organization-defined sources] as posing an increased level of risk.	Indications of increased risk from individuals can be obtained from different sources, including personnel records, intelligence agencies, law enforcement organizations, and other sources. The monitoring of individuals is coordinated with management, legal, security, privacy and human resource officials conducting such monitoring. Monitoring is conducted in accordance with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines.		
SI-4 (20)	2	System and Information Integrity System Monitoring Privileged Users	Implement the following additional monitoring of privileged users: [Assignment: organization-defined additional monitoring].	Information, than the general user population. Access to such information means that privileged users can patentially do greater damage to systems and arganizations than non- privileged users. Therefore, implementing additional monitoring an privileged users helps to ensure that organizations can identify malicious activity at the earliest possible time and take appropriate actions.	AC-18	
SI-4 (21)		System and Information Integrity System Monitoring Probationary Periods	Implement the following additional monitoring of individuals during [Assignment: organization-defined probationary period]: [Assignment: organization-defined additional monitoring].	During probationary periods, employees do not have permanent employment status within organizations. Without such status and having access to information that is resident on the system, additional monitoring can help identify any potentially malicious activity or inappropriate behavior.		
SI-4 (22)	2	System and Information Integrity System Monitoring Unauthorized Network Services	(a) Detect network services that have not been authorized or approved by [Assignment: organization-defined authorization or approval processes], and (b) [Selection (one or more): audit; alert [Assignment: organization-defined personnel or roles]] when detected.	Unauthorized or unapproved network services include services in service-oriented architectures that lack organizational verification or validation and therefore may be unreliable or serve as malicious rogues for valid services.	CM-7	

Control ID L	Level	Control Name Withdrawn	Control Text	Discussion	Related Controls	Notes
SI-4 (23)	2	System and Information Integrity System Monitoring Host-based Devices	Implement the following host-based monitoring mechanisms at [Assignment: organization-defined system components]: [Assignment: organization-defined host-based monitoring mechanisms].	System components where host-based monitoring can be implemented include servers, notebook computers, and mobile devices. Organizations may consider employing host- based monitoring mechanisms from multiple product developers or vendors.	AC-18, AC-19	
Si-4 (24)	2	System and Information Integrity System Monitoring Indicators of Compromise	Discover, collect, and distribute to [Assignment: organization-defined personnel or roles], indicators of compromise provided by [Assignment: organization-defined sources].	Indicators of compromise (IOCI are forensic artifacts from intrusions that are identified an organizational systems at the host or network level. IOCs provide valuable information on systems that have been compromised. IOCs can include the creation of registry key values. IOCs for network traffic include Universal Resource Locator or protocol elements that indicate malicious code command and control servers. The rapid distribution and adoption of IOCs can improve information security by reducing the time that systems and organizations are vulnerable to the same exploit or attack. Threat indicators, signatures, tactics, techniques and procedures, and other indicators of compromise may be available via government and non-government cooperatives including forum of Incident Response and Security Teams, United States Computer Emergency Readiness Team, Defense Industrial Base Cybersecurity Information Sharing Program, and CERT Coordination Center.	AC-18	
SI-4 (25)	2	System and Information Integrity System Monitoring Optimize Network Traffic Analysis	Provide visibility into network traffic at external and key internal system boundaries to optimize the effectivenes of monitoring devices.	SEncrypted traffic, asymmetric routing architectures, capacity and latency limitations, and transitioning from older to newer technologies (e.g., JPv4 to IPv6 network protocol transition), may result in bilind soots for araquations when analyzing network traffic. Collecting, decrypting, pre-processing and distributing only relevant traffic to monitoring devices can streamline efficiency and use of the devices and optimize traffic analysis.		
SI-5	1	System and Information Integrity Security Alerts, Advisories, and Directives	Receive system security alerts, advisories, and directives from [Assignment: organization-defined external organizations] on an ongoing basis; b. Generate internal security alerts, advisories, and directives as deemed necessary; c. Disseminate security alerts, advisories, and directives to: [Selection (one or more): [Assignment: organization defined personnel or roles; [Assignment organization-defined elements within the organization]; [Assignment organization-defined external organizations]]; and d. implement security directives in accordance with established time frames, or notify the issuing organization the degree of noncompliance.	 critical nature of many of these directives and the potential (immediate) adverse effects on organizational operations and assets, individuals, other organizations, and the Nation 	PM-15, RA-5, SI-2	
Si-5 (1)	2	System and Information Integrity Security Alerts, Advisories, and Directives Automated Alerts and Advisories	Broadcast security alert and advisory information throughout the organization using (Assignment: organization defined automated mechanisms).	The significant number of changes to organizational systems and environments of operation requires the dissemination of security-related information to a variety of organizational entities that have a direct interest in the success of organizational missions and business functions. Based on information provided by security olerts and advisories, changes may be required at one or more of the three levels related to the management of information security and privacy risk, including the governance level, mission and business process level, and the information system level.		
SI-6	1	System and Information Integrity Security and Privacy Function Verification	a. Verify the correct operation of [Assignment: organization-defined security and privacy functions]; b. Perform the verification of the functions specified in Si-6a [Selection (one or more); [Assignment: organizatio defined system transitional states]; upon command by user with appropriate privilege; [Assignment: organization-defined frequency]]; c. Notify [Assignment: organization-defined personnel or roles] of failed security and privacy verification tests; and d. [Selection (one or more): Shut the system down; Restart the system; [Assignment: organization-defined alternative action(s)]] when anomalies are discovered.	Transitional states for systems include system startup, restart, shutdown, and abort. System notifications include hardware indicator lights, electronic alerts to system administrators, and messages to local computer consoles. In contrast to security function verification, privacy function verification ensures that privacy functions operate as expected and are approved by the senior agency official for privacy, or that privacy attributes are applied or used as expected.	n CA-7, CM-4, CM-6, SI- 7	
SI-6 (1)	2	System and Information Integrity Security and X Privacy Function Verification Notification of Failed Security Tests System and Information Integrity Security and	Implement automated mechanisms to support the management of distributed security and privacy function	The use of automated mechanisms to support the management of distributed function	SI-2	[Withdrawn: Incorporated into SI-6]

Software includes operating systems (with key internal components such as kernels, drivers), middleware, and applications. Firmware includes the Basic Input Output System (BIOS). Information includes personally identifiable information and metadata	CM-8, MA-3, MA-4, t RA-5, SA-8, SA-9, SA- 10, SC-8, SC-12, SC- 13, SC-28, SC-37, SI-3 SR-3, SR-4, SR-5, SR-	
SI-7 (1)	2	System and Information Integrity Software, Firmware, and Information Integrity Integrity Checks	Perform an integrity check of [Assignment: organization-defined software, firmware, and information] [Selection (one or more): at startup; at [Assignment: organization-defined transitional states or security-relevant events]; [Assignment: organization-defined frequency]].	Security-relevant events include the identification of a new threat to which organizational systems are susceptible, and the installation of new hardware, software, or firmware. Transitional states include system startup, restart, shutdown, and abort.		
SI-7 (2)	2	System and Information Integrity Software, Firmware, and Information Integrity Automated Notifications of Integrity Violations	Employ automated tools that provide notification to [Assignment: organization-defined personnel or rales] upor discovering discrepancies during integrity verification.	The employment of automated tools to report system and information integrity violations and to notify organizational personnel in a timely matter is essential to effective risk response. Personnel howing an interest in system and information integrity violations include mission and business owners, system owners, senior agency information security official, senior agency official of privacy, systems administrators, software developers, systems integrators, and information security officers, and privacy officers.		
SI-7 (3)		System and Information Integrity Software, Firmware, and Information Integrity Centrally- managed Integrity Tools	Employ centrally managed integrity verification tools.	Centrally-managed integrity verification tools provides greater consistency in the application of such tools and can facilitate more comprehensive coverage of integrity verification actions.	AU-3, SI-2, SI-8	
SI-7 (4)	2	System and Information Integrity Software, X Firmware, and Information Integrity Tamper-evident Packaging				[Withdrawn: Incorporated into SR-9]
SI-7 (5)	2	System and Information Integrity Software, Firmware, and Information Integrity Automated Response to Integrity Violations	Automatically [Selection (one or more): shut the system down; restart the system; implement [Assignment: organization-defined controls]] when integrity violations are discovered.	Organizations may define different integrity checking responses by type of information, by specific information, or a combination of both. Types of information include firmware, software, and user date. Specific information includes boot firmware for certain types of machines. The automatic implementation of controls within organizational systems include: reversing the changes, halting the system, or triggering audit alerts when unauthorized modifications to critical security files occur.

SI-7 (6)	2	System and Information Integrity Software, Firmware, and Information Integrity Cryptographic Protection	Withdrawn	Control Date Implement cryptographic mechanisms to detect unauthorized changes to software, firmware, and information.	Discussion Cryptographic mechanisms used to protect integrity include digital signatures and the computation and application of signed hashes using asymmetric cryptography; protecting the confidentiality of the key used to generate the hash; and using the public key to verify	SC-12, SC-13	Notes
					the hash information. Organizations employing cryptographic mechanisms also consider cryptographic key management solutions (see SC-12 and SC-13).		
SI-7 (7)	2	System and Information Integrity Software, Firmware, and Information Integrity Integration of Detection and Response		Incorporate the detection of the following unauthorized changes into the organizational incident response copability: [Assignment: organization-defined security-relevant changes to the system].	This control enhancement helps to ensure that detected events are tracked, monitored, corrected, and available for historical purposes. Mointaining historical records is important both for being able to identify and discern adversary actions over an extended time-period and for possible legal actions. Security-relevant changes include unauthorized changes to established configuration settings or unauthorized elevation of system privileges.	AU-2, AU-6, IR-4, IR- 5, SI-4	
	2	System and Information Integrity Software, Firmware, and Information Integrity Auditing Copability for Significant Events		Upon detection of a potential integrity violation, provide the capability to audit the event and initiate the following actions: [Selection (one or more): generate an audit record; clert current user; clert [Assignment: organization-defined personnel or roles]; [Assignment: organization-defined other actions]].	Organizations select response actions based on types of software, specific software, or information for which there are potential integrity violations.	AU-2, AU-6, AU-12	
SI-7 (9)	2	System and Information Integrity Software, Firmware, and Information Integrity Verify Boot Process		Verify the integrity of the boot process of the following system components: [Assignment: organization-defined system components].	Ensuring the integrity of boot processes is critical to starting system components in known, trustworthy states. Integrity verification mechanisms provide a level of assurance that only trusted code is executed during boot processes.	SI-6	
SI-7 (10)	2	System and Information Integrity Software, Firmware, and Information Integrity Protection of Boot Firmware		Implement the following mechanisms to protect the integrity of boot firmware in [Assignment: organization- defined system components]: [Assignment: organization-defined mechanisms].	Unauthorized modifications to boot firmware may indicate a sophisticated, targeted attack. These types of targeted attacks can result in a permanent denial of service or a persistent maliciaus code persence. These situations can occur, for example, if the firmware is corrupted or if the malicious code is embedded within the firmware. System components can protect the integrity of boot firmware in arganizational systems by verifying the integrity and authenticity of all updates to the firmware prior to applying changes to the system component; and preventing unauthorized processes from modifying the boot firmware.	SI-6	
SI-7 (11)	2	System and Information Integrity Software, Firmware, and Information Integrity Confined Fryirnments with Imited Privilences	Х				[Withdrawn: Moved to CM-7 (6)]
SI-7 (12)	2	Environments win numear privileges. System and Information Integrity Software, Firmware, and Information Integrity Integrity Verification		Require that the integrity of the following user-installed software be verified prior to execution: [Assignment: organization-defined user-installed software].	Organizations verify the integrity of user-installed software prior to execution to reduce the likelihood of executing malicious code or executing code that contains errors from unauthorized modifications. Organizations consider the practicality of approaches to verifying software integrity, including availability of checksums of adequate trustworthiness from software developers or vendors.	CM-11	
SI-7 (13)	2	System and Information Integrity Software, Firmware, and Information Integrity Code Execution in Protected Environments	Χ				[Withdrawn: Moved to CM-7 (7)]
SI-7 (14)	2	System and Information Integrity Software, Firmware, and Information Integrity Binary or Machine Executable Code	Х				[Withdrawn: Moved to CM-7 (8)]
SI-7 (15)	2	System and Information Integrity Software, Firmware, and Information Integrity Code Authentication		Implement cryptographic mechanisms to authenticate the following software or firmware components prior to installation: [Assignment: organization-defined software or firmware components].	Cryptographic authentication includes verifying that software or firmware components have been digitally signed using certificates recognized and approved by organizations. Code signing is an effective method to protect against malicious code. Organizations employing cryptographic mechanisms also consider cryptographic key management solutions (see Sci 21 and Sci 31).	CM-5	
SI-7 (16)	2	System and Information Integrity Software, Firmware, and Information Integrity Time Limit on Process Execution Without Supervision		Prohibit processes from executing without supervision for more than [Assignment: organization-defined time- period].	This control enhancement addresses processes for which typical or normal execution periods can be determined and situations in which organizations exceed such periods. Supervision includes timers on operating systems, automated responses, or manual oversight and response when system process anomalies occur.		
Si-7 (17)	2	System and Information Integrity Software, Firmware, and Information Integrity Runtime Application Self-protection		Implement [Assignment: organization-defined controls] for application self-protection at runtime.	his control enhancement employs runtime instrumentation to detect and block the exploitation of software vulnerabilities by taking advantage of information from the software in execution. Runtime exploit prevention differs from traditional perimeter-based protections such as guards and firewalls, that can only detect and block attacks by using network information without contextual ownerness. Runtime application self-protection technology can reduce the susceptibility of software to attacks by monitoring its inputs, and blocking those inputs that could allow attacks. It can also help protect the runtime environment from unwanted changes and tampering. When a threat is detected, runtime application self-protection technology can prevent exploitation and take other actions (e.g., sending a warning message to the user, terminating the user's session, terminating the application, or sending an alert to organizational personnel). Runtime application self-protection solutions can be deployed in either a monitor or protection mode.	SI-16	
SI-8	1	System and Information Integrity Spam Protection		a. Employ spam protection mechanisms at system entry and exit points to detect and act on unsolicited messages; and b. Update spam protection mechanisms when new releases are available in accordance with organizational configuration management policy and procedures.	System entry and exit points include firewalls, remote-access servers, electronic mail servers, web servers, proxy servers, workstations, notebook computers, and mobile devices. Spam can be transported by different means, including email, email attachments, and web accesses. Spam protection mechanisms include signature definitions.	SC-5, SC-7, SC-38, SI- 3, SI-4	
SI-8 (1)	2	System and Information Integrity Spam Protection Central Management		Centrally manage spom protection mechanisms.	Central management is the organization-wide management and implementation of spam protection mechanisms. Central management includes planning, implementing, assessing, authorizing, and monitoring the organization-defined, centrally managed spam protection controls.	AU-3, CM-6, SI-2, SI-7	
SI-8 (2)	2	System and Information Integrity Spam Protection Automatic Updates		Automatically update spam protection mechanisms [Assignment: organization-defined frequency].	Using automated mechanisms to update spam protection mechanisms helps to ensure that updates occur on a regular basis and provide the latest content and protection capability.		
SI-8 (3)	2	System and Information Integrity Spam Protection Continuous Learning Capability		Implement spam protection mechanisms with a learning copability to more effectively identify legitimate communications traffic.	Learning mechanisms include Bayesian filters that respond to user inputs identifying specific traffic as spam or legitimate by updating algorithm parameters and thereby more accurately separating types of traffic.

SI-10	1	System and Information Integrity Information Input	Control Text Check the validity of the following information inputs: [Assignment: organization-defined information inputs to	Checking the valid syntax and semantics of system inputs, including character set, length,	Related Controls Notes
SI-10	1	System and Information Integrity Information Input Validation	Check the validity of the following information inputs: [Assignment: organization-defined information inputs to the system].	Checking the valid syntax and semantics of system inputs, including character set, length, numerical range, and acceptable values, verifies that inputs match specified definitions for format and content. For example, if the organization specifies that numerical values between 1.100 are the only acceptable inputs for a field in a given application, inputs of 387, also, or %K/Sx are invalid inputs and are not accepted as input to the system. Valid inputs are likely to vary from field to field within a software application. Applications typically follow well-defined protocols that use structured messages (i.e., commands or queries) to communicate between software modules or system components. Structured messages contain are or unstructured data interspersed with metadata or control information. If software applications use attacker-supplied inputs to construct structured messages without properly encoding such messages, then the attacker could insert malicious commands or special characters that can cause the data to be interpreted as control information or metadata. Consequently, the module or component that receives the	
SI-10 (1)	2	System and Information Integrity Information Input	(a) Provide a manual override capability for input validation of the following information inputs: [Assignment:	corrupted output will perform the wrong operations or otherwise interpret the data incorrectly. Prescreening inputs prior to passing to interpreters prevents the content from being unintentionally interpreted as commands. Input validation ensures accurate and correct inputs and prevent attacks such as cross-site scripting and a variety of injection attacks. In certain situations, for example, during events that are defined in contingency plans, a	AC-3, AU-2, AU-12
		Validation Manual Override Capability	organization-defined inputs]; (b) Restrict the use of the manual override capability to only (Assignment: organization-defined authorized individuals); and (c) Audit the use of the manual override capability.	manual override capability for input validation may be needed. Manual overrides are used only in limited circumstances and with the inputs defined by the organization.	
SI-10 (2)	2	System and Information Integrity Information Input Validation Review and Resolve Errors	Review and resolve input validation errors within [Assignment: organization-defined time-period].	Resolution of input validation errors includes correcting systemic causes of errors and resubmitting transactions with corrected input.	
SI-10 (3)		System and Information Integrity Information Input Validation Predictable Behavior	Verify that the system behaves in a predictable and documented manner when invalid inputs are received.	A common vulnerability in organizational systems is unpredictable behavior when invalid inputs are received. This control enhancement ensures that there is predictable behavior when the system receives invalid inputs by specifying system responses that allow the system to transition to known states without adverse, unintended side effects. The invalid inputs are those inputs related to the information inputs defined by the organization in the base control.	
SI-10 (4)	2	System and Information Integrity Information Input Validation Timing Interactions	Account for timing interactions among system components in determining appropriate responses for invalid inputs.	In addressing invalid system inputs received across protocol interfaces, timing interactions become relevant, where one protocol needs to consider the impact of the error response on other protocols in the protocol stock. For example, 802.11 standard wireless network protocols do not interact well with Transmission Control Protocols (TCP) when packets are dropped (which could be due to invalid packet input). TCP assumes packet losses are due to congestion, while packets lost over 802.11 links are typically dropped due to noise or collisions on the link. If TCP makes a congestion response, it takes the wrong action in response to a collision extended and account of the protocols in concert to achieve adverse effects through suitable construction of invalid input.	
SI-10 (5)	2	System and Information Integrity Information Input Validation Restrict Inputs to Trusted Sources and Approved Formats	Restrict the use of information inputs to [Assignment: organization-defined trusted sources] and/or [Assignment: organization-defined formats].	This control enhancement applies the concept of whitelisting to information inputs. Specifying known trusted sources for information inputs and acceptable formats for such inputs can reduce the probability of malicious activity.	AC-3, AC-6
SI-10 (6)	2	System and Information Integrity Information Input Validation Injection Prevention	Prevent untrusted data injections.	Untrusted data injections may be prevented using, for example, a parameterized interface or output escaping (output encoding). Parameterized interfaces separate data from code so injections of malicious or unintended data cannot change the semantics of the command being sent. Output escaping uses specified characters to inform the interpreter's parser whether data is trusted.	AC-3, AC-6
SI-11	1	System and Information Integrity Error Handling	a. Generate error messages that provide information necessary for corrective actions without revealing information that could be expolicited; and b. Reveal error messages only to [Assignment: organization-defined personnel or roles].	Organizations consider the structure and the content of error messages. The extent to which systems can handle error conditions is guided and informed by organizational policy and operational requirements. Exploitable information includes stack traces and implementation details, erroneous logon attempts with passwords mistakenly entered as the username; mission or business information that can be derived from, if not stated explicitly by, the information recorded; and personally identifiable information such as account numbers, social security numbers, and credit card numbers. Error messages may also provide a covert channel for transmitting information.	AU-2, AU-3, SC-31, SI- 2
SI-12	1	System and Information Integrity Information Management and Retention	Manage and retain information within the system and information output from the system in accordance with applicable laws, executive orders, directives, regulations, policies, standards, guidelines and operational requirements.	information, in some cases extending beyond system disposal. Information to be retained may also include policies, procedures, plans, and other types of administrative information. The National Archives and Records Administration (NARA) provides federal policy and guidance on records retention. If organizations have a records management office, consider coordinating with records management personnel.	AC-1, AT-1, AU-1, CA- 1, CM-1, CP-1, IA-1, IR-1, MA-1, MP-1, PE- 1, PL-1, PM-1, PS-1, PT-1, RA-1, SA-1, SC- 1, SI-1, SR-1, AC-16, AU-5, AU-11, CA-2, CA-3, CA-5, CA-6, CA- 7, CA-9, CM-5, CM-9, CP-2, IR-8, MP-2, MP-3, MP-4, MP-6, PL-2, PL-4, PM-4, MP-6, PL-2, PL-4, PM-4, MP-6, PL-2, PL-4, PM-4, MP-6, PL-2, PL-4, PM-4, PM-8, PM-9, PS-2, PS-6, PT- 1, PT-2, PT-3, RA-2, RA-3, SA-5, SR-1
SI-12 (1)		System and Information Integrity Information Management and Retention Limit Personally Identifiable Information Elements	Limit personally identifiable information being processed in the information life cycle to the following elements of PII: [Assignment: organization-defined elements of personally identifiable information].	when the information is not needed for operational purposes helps to reduce the level of privacy risk created by a system. The information life cycle includes information creation, collection, use, processing, storage, maintenance, dissemination, disclosure, and disposition. Risk assessments as well as applicable laws, regulations, and policies can provide useful inputs to determining which elements of personally identifiable information may create risk.	RA-3
SI-12 (2)	2	System and Information Integrity Information Management and Retention Minimize Personally identificable Information in Testing, Training, and Research	Use the following techniques to minimize the use of personally identifiable information for research, testing, or training: [Assignment: organization-defined techniques].	Organizations can minimize the risk to an individual's privacy by employing techniques such as de-identification or synthetic data. Limiting the use of personally intentifiable information throughout the information life cycle when the information is not needed for research, testing, or training helps reduce the level of privacy risk cented by a system. Risk assessments as well as applicable lows, regulations, and policies can provide useful inputs to determining the techniques to use and when to use them.	PM-22, PM-25, SI-19

31-12 (3)	2	Management and Retention Information Disposal	Ose the jointhing of the chiniques of th	when it is no longer needed. Disposal or destruction of information applies to originals as well as copies and archived records, including system logs that may contain personally identifiable information.	Wir-o	
SI-13		System and Information Integrity Predictable Failure Prevention	a. Determine mean time to failure (MTTF) for the following system components in specific environments of operation: [Assignment: organization-defined system components]; and b. Provide substitute system components and a means to exchange active and standby components in accordance with the following criteria: [Assignment: organization-defined MTTF substitution criteria].	While MTTF is primarily a reliability issue, this control addresses potential fallures of system components that provide security capability. Failure rates reflect installation-specific consideration, not industry-average. Organizations define the criteria for substitution of system components based on the MTTF value with consideration for resulting potential harm from component failures. Transfer of responsibilities between active and standby components does not compromise safety, operational readiness, or security capability. This includes preservation of system state variables. Standby components remain available at all times except for maintenance issues or recovery failures in progress.	MA-2, MA-6, SA-8, SC 6	
SI-13 (1)	2	System and Information Integrity Predictable Failure Prevention Transferring Component Responsibilities	Toke system components out of service by transferring component responsibilities to substitute components no later than [Assignment: organization-defined fraction or percentage] of mean time to failure.	Transferring primary system component responsibilities to other substitute components prior to primary component failure is important to reduce the risk of degraded or debilitate mission or business operations. Making such transfers based on a percentage of mean time to failure allows organizations to be proactive based on their risk tolerance. However, premature replacement of system components can result in increased cost of system operations.		
SI-13 (2)	2	System and Information Integrity Predictable Failure X Prevention Time Limit on Process Execution Without Supervision				[Withdrawn: Incorporated into Si-7 (16)]
SI-13 (3)		System and Information Integrity Predictable Failure Prevention Manual Transfer Between Components	Manually initiate transfers between active and standby system components when the use of the active component reaches [Assignment: organization-defined percentage] of the mean time to failure.	For example, if the MTTF for a system component is one hundred days and the organization defined percentage is ninety percent, the manual transfer would occur after ninety days.		
SI-13 (4)		System and Information Integrity Predictable Failure Prevention Standby Component Installation and Notification	If system component failures are detected: (a) Ensure that the standby components are successfully and transparently installed within [Assignment: organization-defined time-period]; and (b) [Selection (one or more): Activate [Assignment: organization-defined alarm]; Automatically shut down the system; [Assignment: organization-defined action]].	Automatic or manual transfer of components from standby to active mode can occur, for example, upon detection of component failures.		
SI-13 (5)		System and Information Integrity Predictable Failure Prevention Failover Capability	Provide [Selection: real-time; near real-time] [Assignment: organization-defined failover capability] for the system.	Failover refers to the automatic switchover to an alternate system upon the failure of the primary system. Failover capability includes incorporating mirrored system operations at alternate processing sites or periodic data mirroring at regular intervals defined by recovery time-periods of organizations.		
SI-14	1	System and Information Integrity Non-persistence	Implement non-persistent [Assignment: organization-defined system components and services] that are initiated in aknown state and terminated [Selection (one or more): upon end of session of use; periodically at [Assignment: organization-defined frequency]].	This control mitigates risk from advanced persistent threats (APTs) by significantly reducing the targeting capability of adversaries (i.e., window of opportunity and available attack surface) to initiate and complete attacks. By implementing the concept of non-persistence for selected system components, organizations can provide a known state computing resource for a specific time-period that does not give adversaries sufficient time to exploit vulnerabilities in organizational systems and the environments in which those systems operate. Since the APT is a high-end, sophisticated threat regarding capability, intent, and targeting, organizational systems and the environments in which those systems operate. Since the APT is a high-end, sophisticated threat regarding capability, intent, and targeting, organizations assume that over an extended period, a percentage of attacks will be successful. Mon-persistence increases the work factor of adversaries in attempting to compromise or bread organizational systems. Non-persistence can be achieved by refreshing system components by periodically reinaging components or by using a variety of common virtualization techniques. Non-persistent services can be implemented by using virtualization techniques as part of virtual machines or a sene winstances of organization for first determine whether compromises of components or services have occurred (something that may often be difficult to determine). The refresh of selected system components and services is that it the spread or intended impact of attacks, but not with such frequency to prevent the spread or intended impact of attacks, but not with such frequency that it makes the system unstable. Refreshes of critical components and services may be done periodically to hinder the ability of adversaries to exploit optimum windows of vulnerabilities.		
SI-14 (1)	2	System and Information Integrity Non-persistence	Obtain software and data employed during system component and service refreshes from the following trusted	Trusted sources include software and data from write-once read-only media or from		
SI-14 (2)	2	Refresh from Trusted Sources System and Information Integrity Non-persistence Non-persistent Information	Sources: [Assignment: organization-defined trusted sources]. [a) [Selection: refresh [Assignment: organization-defined information] [Assignment: organization-defined frequency] ; generate [Assignment: organization-defined frequency] ; generate [Assignment: organization-defined information] on demand]; and [b) Delete information when no longer needed.	selected off-line secure storage facilities. Activing information longer than it is needed makes the information a potential target for advanced adversories searching for high value assets to compromise through unauthorized disclosure, unauthorized modification, or expliration. For system-related information, unnecessory retention provides advanced adversaries information that can assist in their reconnaissance and lateral movement through the system.		
SI-14 (3)		System and Information Integrity Non-persistence Non-persistent Connectivity	Establish connections to the system on demand and terminate connections after [Selection: completion of a request; a period of non-use].	Persistent connections to systems can provide advanced adversaries with paths to move laterally through systems, and potentially position themselves claser to high value assets. Limiting the availability of such connections impedes the adversary's ability to move freely arganizational systems.	SC-10	
SI-15		System and Information Integrity Information Output Filtering	Validate information output from the following software programs and/or applications to ensure that the information is consistent with the expected content: [Assignment: organization-defined software programs and/or applications].	Certain types of attacks, including SQL injections, produce output results that are unexpected or inconsistent with the output results that would be expected from software programs or applications. Information output filtering focuses on detecting extraneous content, preventing such extraneous content from being displayed, and then alerting monitoring tools that anomalous behavior has been discovered.	SI-3, SI-4	
SI-16		System and Information Integrity Memory Protection	Implement the following controls to protect the system memory from unauthorized code execution: [Assignment: organization-defined controls].	Some adversaries launch attacks with the intent of executing code in non-executable regions of memory or in memory locations that are prohibited. Controls employed to protect memory include data execution prevention and address space layout randomization. Data execution prevention controls can either be hardware-enforced or software-enforced with hardware enforcement providing the greater strength of mechanism.	AC-25, SC-3	
SI-17	1	System and Information Integrity Fail-safe Procedures	Implement the indicated fail-safe procedures when the indicated failures occur: [Assignment: organization- defined list of failure conditions and associated fail-safe procedures].	Failure conditions include loss of communications among critical system components or between system components and operational facilities. Fail-safe procedures include alerting operator personnel and providing specific instructions on subsequent steps to take These steps include doing nothing, reestablishing system settings, shutting down processes restarting the system, or contacting designated organizational personnel.

SI-18	1	System and Information Integrity Personally	a. Check the accuracy, relevance, timeliness, and completeness of personally identifiable information across the	Personally identifiable information quality operations include the steps that organizations	PM-22, PM-24, SI-4	Notes
		Identifiable Information Quality Operations	information life cycle (Assignment: organization-defined frequency); and b. Correct or delete inaccurate or outdated personally identifiable information.	take to confirm the accuracy and relevance of personally identifiable information throughout the information life cycle. The information life cycle includes the creation, collection, use, processing, storage, maintenance, dissemination, discourse, and disposal of personally identifiable information. Personally identifiable information quality operations include editing and validating addresses as they are collected or entered into systems using automated address verification look-up application programming interfaces. Checking personally identifiable information quality includes the tracking of updates or changes to data over time, which enables organizations to know how and what personally identifiable information or particularly information was changed should erroneous information be identified. The measures taken to protect personally identifiable information, how it is to be used, how it was obtained, and potential de-identification methods employed. The measures taken to validate the accuracy of personally identifiable information used to make determinations about the rights, benefits, or privileges of individuals covered under federal programs may be more comprehensive than the measures used to validate personally identifiable information used for less sensitive purposes.		
SI-18 (1)	2	System and Information Integrity Personally Identificable Information Quality Operations Automation	Correct or delete personally identifiable information that is inaccurate or outdated, incorrectly determined regarding impact, or incorrectly de-identified using [Assignment: organization-defined automated mechanisms].	The use of automated mechanisms to improve data quality may inadvertently create privacy risks. Automated tools may connect to external or otherwise unrelated systems, and the matching of records between these systems may create linkages with unintended consequences. Organizations assess and document these risks in their privacy impact assessment and make determinations that are in alignment with their privacy program plan. As data is obtained and used across the information ille cycle, it is important to confirm the accuracy and relevance of personally identifiable information. Automated mechanisms can augment existing data quality processes and procedures and enable an organization to better identify and manage personally identifiable information in large-scale systems. For example, automated tools can agreatly improve efforts to consistently normalize data or identify malfamed data. Automated tools can also be used to improve auditing of data and detect errors that may incorrectly alter personally identifiable information or incorrectly associate such information with the wrong individual. Automated capabilities backstop processes and procedures are scale and enable more fine-grained detection and correction of data quality errors.	PM-18, PM-22, RA-8	
SI-18 (2)	2	System and Information Integrity Personally Identifiable Information Quality Operations Data Tags	Employ data tags to automate the correction or deletion of personally identifiable information across the information life cycle within organizational systems.	Data tagging personally identifiable information includes tags noting processing permissions, authority to process, de-identification, impact level, information life cycle stage, and retention or last updated dates. Employing data tags for personally identifiable information can support the use of automation tools to correct or delete relevant personally identifiable information.	SC-16	
SI-18 (3)	2	System and Information Integrity Personally Identifiable Information Quality Operations Collection	Collect personally identifiable information directly from the individual.	Individuals, or their designated representatives, can be a source of correct personally identifiable information about themselves. Dragnizations consider contextual factors that may incentive individuals to provide correct data versus providing lable data. Additional steps may be necessary to validate collected information based on the nature and context of the personally identifiable information have it is to be used, and how! twas obtained. Measures taken to validate the accuracy of personally identifiable information used to make determinations about the rights, benefits, or privileges of individuals under federal programs may be more comprehensive than those used to validate less sensitive personally identifiable information.		
SI-18 (4)	2	System and Information Integrity Personally identifiable Information Quality Operations Individual Requests	Correct or delete personally identifiable information upon request by individuals or their designated representatives.	inaccurate personally identifiedbe information maintained by arganizations may cause problems for individuals, especially in those business functions where inaccurate information may result in inappropriate decisions or the denial of benefits and services to individuals. Even correct information, in certain circumstances, can cause problems for individuals in to active information, in certain circumstances, can cause problems for individuals that outweigh the benefits of an arganization maintaining the information. Organizations use discretion in determining if personally identifiable information is to be corrected or defeted, based on the scope of requests, the changes sought, the impact of the changes, and applicable laws, regulations, and policies. Organizational personnel consult with the senior agency official for privacy and legal counsel regarding appropriate instances of correction or deletion.	PM-22	
SI-18 (5)	2	System and Information Integrity Personally Identifiable Information Quality Operations Notice of Collection or Deletion	Notify [Assignment: organization-defined recipients of personally identifiable information] and individuals that the personally identifiable information has been corrected or deleted.	When personally identifiable information is corrected or deleted, organizations take steps to ensure that all authorized recipients of such information, and the individual with which the information is associated or their designated representative, are informed of the corrected or deleted information.		
SI-19	1	System and Information Integrity De-Identification	a. Remove the following elements of personally identifiable information from datasets: [Assignment: organization-defined elements of personally identifiable information]; and b. Evaluate [Assignment: organization-defined frequency] for effectiveness of de-identification.	De-identification is the general term for the process of removing the association between a	MP-G, PM-22, PM-23, PM-24, RA-2, SI-12	
SI-19 (1)	2	System and Information Integrity De-identification Collection	De-identify the dataset upon collection by not collecting personally identifiable information.	If a data source contains personally identifiable information but the information will not be used, the dataset can be de-identified upon creation by not collecting the data elements containing the personally identifiable information. For example, if an organization does not intend to use the social security number of an applicant, then application forms do not ask for a social security number.		

Control ID	l accord	Control Name	Control Text	Planata	Related Controls	Makes
SI-19 (2)	2	System and Information Integrity De-identification Archiving	Prohibit archiving of personally identifiable information elements if those elements in a dataset will not be needed after the dataset is archived.	Discussion Dotasets can be archived for many reasons. The envisioned purposes for the archived dataset are specified and if personally identifiable information elements are not required, the elements are not archived. For example, social security numbers may have been collected for record linkage, but the archived dataset may include the required elements from the linked records. In this case, it is not necessary to archive the social security numbers.	Related Controls	NOTES -
SI-19 (3)		System and Information Integrity De-identification Release	dataset do not need to be part of the data release.	Prior to releasing a dataset, a data custodian considers the intended uses of the dataset and determines if it is necessary to release personally identifiable information. If the personally identifiable information is not necessary, the information can be removed using de-identification techniques.		
SI-19 (4)		System and Information Integrity De-identification Removal, Mosking, Encryption, Hashing, or Replacement of Direct Identifiers	Remove, mask, encrypt, hash, or replace direct identifiers in a dataset.	There are many possible pracesses for removing direct identifiers from a dataset. Columns in a dataset that contain a direct identifier as he memoved. In masking, the direct identifier is transformed into a repeating character, for example, XXXXXX or 999999. Identifiers can be encrypted or hashed, so that the linked records remain linked. In the case of encryption of hashing, algorithms are employed that require the use of a key, including the Advanced Encryption Standard or a Hosh-based Message Authentication Code. Implementations Migrent was the same key for all identifiers or use a different key for each identifier. Using a different key for each identifier so revolveds for a higher degree of security and privacy. Identifiers can alternatively be replaced with a keyword, including transforming "George Washington" to "PATIENT," or replaced with a surrogate value, for example, transforming "George Washington" to "Abrohom Palk."	SC-12, SC-13	
SI-19 (5)		System and Information Integrity De-identification Statistical Disclosure Control	Manipulate numerical data, contingency tables, and statistical findings so that no person or organization is identifiable in the results of the analysis.	Many types of statistical analyses can result in the disclosure of information about individuals even if only summary information is provided. For example, if a school publishes a monthly table with the number of minority students, and in January the school reports that it has 10-19 such students, but in March it reports that it has 20-29 students, then it can be inferred that the student who enrolled in February was a minority.		
SI-19 (6)		System and Information Integrity De-identification Differential Privacy	Prevent disclosure of personally identifiable information by adding non-deterministic noise to the results of mathematical operations before the results are reported.	The mathematical definition for differential privacy holds that the result of a dataset analysis should be approximately the same before and after the addition or removal of a single data record (which is assumed to be the data from a single individual). In its most be used to produce machine-learning statistical classifies and synthetic data. Differential privacy comes at the cast of decreased accuracy of results, forcing organizations to quantify the trade-off between privacy protection and the overall accuracy, usefulness, and willow the de-identified dataset. Non-deterministic noise can include adding small random values to the results of mathematical operations in dataset analysis.	SC-12, SC-13	
SI-19 (7)	2	System and Information Integrity De-identification Validated Software	Perform de-identification using validated algorithms and software that is validated to implement the algorithms.	Algorithms that appear to remove personally identifiable information from a dataset may in fact leave information that is personally identifiable or data that are re-identifiable. Software that is claimed to implement a validated algorithm may contain bags or may implement a different algorithm. Software may de-identify one type of data, for example, integers, but not another type of data, for example, floating point numbers. For these reasons, de-identification is performed using algorithms and software that are validated.		
SI-19 (8)	2	System and Information Integrity De-identification Motivated Intruder	Perform a motivated intruder test on the de-identified dataset to determine if the identified data remains or if the de-identified data can be re-identified.	A motivated intruder test is a test in which a person or group takes a data release and specified resources and attempts to re-identify one or more individuals in the de-identified dataset. Such tests specify the amount of inside knowledge, computational resources, financial resources, data, and skills that intruders have at their disposal to conduct the tests. A motivated intruder test can determine if de-identification is insufficient. It can also be a useful diagnostic tool to assess if de-identification is likely to be sufficient. However, the test alone cannot prove that de-identification is sufficient.		
SI-20	1	System and Information Integrity Tainting	Embed data or capabilities in the following systems or system components to determine if organizational data has been exfiltrated or improperly removed from the organization: [Assignment: organization-defined systems or system components].	Many cyber-attacks target organizational information (or sensitive information the organization holds on behalf of other entities (e.g., personally identifiable information) and entitrate that data. In addition, insider attacks and erroneous user procedures can remove information from the system in violation of the organizational policies. Tainting approaches can range from passive to active. A passive tainting approaches a be a simple as adding false email anames and addresses to an internal database. If the organization receives email at one of the false email addresses, it knows that the database has been compromised. Moreover, the organization knows that the email was sent by an unauthorized entity so any packets it includes potentially contain malicious code and that the unauthorized entity potentially has obtained a copy of the database. A less passive tainting approach can include embedding false data or steganographic data in files to enable the data to be found via open source analysis. And finally, an active tainting approach can include embedding software in the data that is able to "call home" alerting the organization to its "capture" and possibly its location and the path by which it was exfiltrated or removed.		
SI-21	1	System and Information Integrity Information Refresh	Refresh [Assignment: organization-defined information] at [Assignment: organization-defined frequencies] or generate the information on demand and delete the information when no longer needed.	Retaining critical or sensitive information (e.g., classified information or controlled unclassified information for longer than it is needed makes it an increasing valuable and enticing target for adversaries. Keeping such information available for the minimum period of time needed for mission accomplishment reduces the opportunity for adversaries to compromise, capture, and exfiltrate that information.	SI-14	
SI-22		System and Information Integrity Information Diversity	a. Identify the following alternative sources of information for [Assignment: organization-defined essential functions and services]: [Assignment: organization-defined alternative information sources]; and b. Use an alternative information source for the execution of essential functions or services on [Assignment: organization-defined systems or system components] when the primary source of information is corrupted or unavailable.	Actions taken by a system service or a function are often driven by the information it receives. Corruption, fabrication, modification, or deletion of that information could impact the ability of the service function to properly carry out its intended actions. By having multiple sources of input, the service or function can continue operation if one source is corrupted or no longer available. It is possible that the alternative sources of information may be less precise or less accurate than the primary source of information. But having such sub-optimal information sources may still provide a sufficient level of quality that the essential service or function can be carried out, even in a degraded or debilitated manner.		

Control ID	Lovel	Control Name Withdrawn	Control Text	Discussion	Palated Controls	Notes
SI-23	1	System and information integrity Information Fragmentation	Based on [Assignment: organization-defined circumstances]: a. Fragment the following information: [Assignment: organization-defined information]; and b. Distribute the fragmented information across the following systems or system components: [Assignment: Assignment organization-defined systems or system components].	One major objective of the advanced persistent threat is to exfiltrate sensitive and valuable information. Once exfiltrated, there is generally no way for the organization to recover the lost information. Therefore, organizations may consider taking the information and dividing it into disparate elements and then distributing those elements across multiple systems or system components and locations. Such actions will increase the adversary's work factor to apture and exfiltrate the desired information and in so doing, increase the probability of detection. The fragmentation of information also impacts the organization's ability to access the information in a timely manner. The extent of the fragmentation would likely be dictated by the sensitivity (and value) of the information, threat intelligence information received, and if data taining is used (i.e., data taining deviced information about exfiltration of some information could result in the fragmentation of the remaining information).		
SR SR-1		Supply Chain Risk Management Policy and Procedures	a. Develop, document, and disseminate to [Assignment: organization-defined personnel or roles]: 1. [Selection (one or more): organization-level; mission/business process-level; system-level] supply chain risk management policy that: (a) Addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compilance; and (b) Is consistent with applicable laws, executive orders, directives, regulations, policies, standards, and guidelines; and 2. Procedures to facilitate the implementation of the supply chain risk management policy and the associated supply chain risk management controls; b. Designate an [Assignment: organization-defined official) to manage the development, documentation, and dissemination of the supply chain risk management policy and procedures; and c. Review and update the current supply chain risk management: 1. Policy [Assignment: organization-defined frequency]; and 2. Procedures [Assignment: organization-defined frequency].	This control addresses policy and procedures for the controls in the SR family implemented within systems and organizations. The risk management strategy is an important factor in establishing such policies and procedures. Policies and procedures help provide security and rivacy programs collaborate on their development. Security and privacy program policies and procedures at the organization level are preferable, in general, and may obviate the need for system-specific policies and procedures. The policy can be included as part of the general security and privacy policy or can be represented by multiple policies reflecting the complex nature of organizations. Procedures can be established for security and privacy policy or can be represented by multiple policies or controls are implemented and can be directed at the individual or role that is the object of the procedure. Procedures can be documented in system security and privacy plans or in one or more separate documents. Restating controls does not constitute an organizational policy or procedure.		
SR-2	1	Supply Chain Risk Management Supply Chain Risk Management Plan	a. Develop a plan for managing supply chain risks associated with the research and development, design, manufacturing, acquistion, delivery, integration, operations, and disposal of the following systems, system components or system services: [Assignment: organization-defined systems, system components, or system services;]. b. implement the supply chain risk management plan consistently across the organization; and c. Review and update the supply chain risk management plan [Assignment: organization-defined frequency] or as required, to address threat, organizational or environmental changes.	organization. Specific threat actions that may increase risk include the insertion or use of	CA-2, CP-4, IR-4, IM-6,	
SR-2 (1)	2	Supply Chain Risk Monogement Supply Chain Risk Management Plan Establish Scrm Team	Establish a supply chain risk management team consisting of [Assignment: organization-defined personnel, roles, and responsibilities] to lead and support the following SCRM activities: [Assignment: organization-defined supply chain risk management activities].	To implement supply chain risk management plans, organizations establish a coordinated team-based approach to identify and assess supply chain tisks and manage these risks by using programmatic and technical mitigation techniques. The team approach enables organizations to conduct an analysis of their supply chain, communicate with external partners or stakeholders, and gain broad consensus regarding the appropriate resources for SCRM. The SCRM team consists of organizational personnel with diverse roles and responsibilities for leading and supporting SCRM activities, including risk executive, information technology, contracting, information security, privacy, mission or business, legal, supply chain and logistics, caquisition, and har relevant functions. Members of the SCRM team are involved in the various aspects of the SDLC and collectively, have an ownerness of, and provide expertise in acquisition processes, legal practices, vulnerabilities, threats, and attack vectors, as well as an understanding of the technical aspects and dependencies of systems. The SCRM team can be an extension of the security and privacy is kmanagement processes or can be included as part of a general organizational risk management team.		
SR-3	1	Supply Chain Risk Management Supply Chain Controls and Processes	a. Establish a process or processes to identify and address weaknesses or deficiencies in the supply chain elements and processes of [Assignment: organization-defined system or system component] in coordination with [Assignment: organization-defined supply chain personnel]: b. Employ the following supply chain controls to protect against supply chain risks to the system, system component, or system service and to limit the harm or consequences from supply chain-related events: [Assignment: organization-defined supply chain controls]; and C. Occument the selected and implemented supply chain processes and controls in [Selection: security and privacy plans; supply chain risk management plan; [Assignment: organization-defined document]].	system components. Supply chain processes include hardware, software, and firmware development processes; shipping and handling procedures; personnel security and physical security programs; configuration management took, techniques, and measures to maintain provenance; or other programs, processes, or procedures associated with the		
SR-3 (1)	2	Supply Chain Risk Management Supply Chain Controls and Processes Diverse Supply Base	Employ a diverse set of sources for the following system components and services: [Assignment: organization- defined system components and services].	Diversifying the supply of system, system components and services can reduce the probability that adversaries will successfully identify and target the supply chain, and can reduce the import of a supply chain event or componers. Identifying multiple suppliers for replacement components can reduce the probability that the replacement component will become unavailable; employing a diverse set of developers or logistics service providers can reduce the impact of a natural disaster or other supply chain event. Organizations consider designing the system to include diversity of materials and components.		

Comband ID	Laurel	Control Name	Control Trus	Plannelse	Deleted Controls	Netro
SR-3 (2)	2	Control Name Withdrawn Supply Chain Controls and Processes Limitation of Harm	Control Text Employ the following supply chain controls to limit harm from potential adversaries identifying and targeting the organizational supply chain: [Assignment: organization-defined controls].	identifying and targeting the supply chain include avoiding the purchase of custom or non- standardized configurations, employing approved worldow lists with standing regutations in industry, following pre-agreed maintenance schedules and update and patch delivery mechanisms; maintaining a contingency plan in case of a supply chain event, and using procurement carve outs that provide exclusions to commitments or obligations, using diverse delivery routes; and minimizing the time between purchase decisions and delivery.	Nei ated Controls	notes
SR-4	1	Supply Chain Risk Management Provenance	Document, monitor, and maintain valid provenance of the following systems, system components, and associated data: [Assignment: organization-defined systems, system components, and associated data].	Every system and system component has a point of origin and may be changed throughout its existence. Provenance is the chronology of the origin, development, ownership, location, and changes to a system or system component and associated data. It may also include personnel and processes used to interact with or make modifications to the system, component, or associated data. Organizations consider developing procedures (see SR-1) for allocating responsibilities for the creation, maintenance, and monitoring of provenance for systems and system components; transferring provenance documentation and responsibility between organizations; and preventing and monitoring for unauthorized changes to the provenance consolider developing methods to document, monitor, and maintain valid provenance baselines for systems, system components, and related data. Such actions help track, assess, and document changes to the provenance, including changes in supply chain elements or configuration, and help ensure non-repudiation of provenance information and the provenance change records.		
SR-4 (1)	2	Supply Chain Risk Management Provenance Identity	Establish and maintain unique identification of the following supply chain elements, processes, and personnel associated with the identified system and critical system components (Assignment: organization-defined supply chain elements, processes, and personnel associated with organization-defined systems and critical system components).	knowing who and what is in the supply chains of organizations is critical to gaining visibility into supply chain activities is slightly into supply chain activities is slow important for monitoring and identifying high-risk events and activities. Without reasonable visibility into supply chain activities is obtained in a considerable	IA-2, IA-8, PE-16	
SR-4 (2)	2	Supply Chain Risk Management Provenance Track and Trace	Establish and maintain unique identification of the following systems and critical system components for tracking through the supply chain: [Assignment: organization-defined systems and critical system components].	Tracking the unique identification of systems and system components during development and transport activities provides o foundational identity structure for the establishment and maintenance of provenance. For example, system components may be labeled using serial numbers or tagged using radio-frequency identification tags. Labels and tags can help provide better visibility into the prevanence of a system or system component. A system or system component may have more than one unique identifier. Identification methods are sufficient to support a forensic investigation after a supply chain compromise or event.		
SR-4 (3)	2	Supply Chain Risk Management Provenance Validate as Genuine and Not Altered	Employ the following controls to validate that the system or system component received is genuine and has not been altered: [Assignment: organization-defined controls].	For many systems and system components, especially hardware, there are technical means to determine if the items are genuine or have been oltered, including optical and nanotechnology togging; physically unclanable functions, side-channel analysis; cryptographic hash verifications or digital signatures; and visible anti-tamper labels or stricers. Controls can also include monitoring for out of specification performance, which can be an indicator of tampering or counterfeits. Organizations may leverage supplier and contractor processes for validating that a system or component is genuine and has not been altered, and for replacing a suspect system or component. Some indications of tampering may be visible and addressoble before accepting delivery, including inconsistent packaging, broken seals, and incorrect labels. When a system or system component is suspected of being altered or counterfeit, the supplier, contractor, or original equipment manufacturer may be able to replace the litem or provide a forensic capability to determine the origin of the counterfeit or altered item. Organizations can provide training to personnel on how to identify suspicious system or component deliveries.	AT-3, SR-9, SR-10, SR-11	
SR-5		Supply Chain Risk Management Acquisition Strategies, Tools, and Methods	Employ the following acquisition strategies, contract tools, and procurement methods to protect against, identify, and mitigate supply chain risks: [Assignment: organization-defined acquisition strategies, contract tools, and procurement methods].	chain. There are many useful tools and techniques available, including obscuring the end use of a system or system component; using blind or filtered buys; requiring tamper-	AT-3, SA-2, SA-3, SA-4, SA-5, SA-4, SA-5, SA-8, SA-9, SA-10, SA-15, SA-6, SA-10, SA-15, SA-15, SA-15, SA-15, SA-15, SA-15, SA-15, SR-9, SR-10, SR-11	
SR-5 (1)		Supply Chain Risk Management Acquisition Strategies, Tools, and Methods Adequate Supply	Employ the following controls to ensure an adequate supply of [Assignment: organization-defined critical system components]: [Assignment: organization-defined controls].	Adversaries can attempt to impede organizational operations by disrupting the supply of critical system components or corrupting supplier operations. Organizations may track systems and component mean time to failute to militigate the loss of temporary or permanent system function. Controls to ensure that adequate supplies of critical system components include the use of multiple suppliers throughout the supply chain for the identified critical components. Stockspling spare components to ensure operation during mission-critical times, and the identification of functionally-identical or similar components that may be used, if necessary.

Related Controls 7, SR-9 Notes
SR-6	1	Supply Chain Risk Management Supplier Reviews	Review the supply chain-related risks associated with suppliers or contractors and the system, system component, or system service they provide (Assignment: organization-defined frequency).	A review of supplier risk includes security processes, foreign ownership, control or influence (FCOI), and the ability of the supplier to effectively assess any subsordnate second-tier and third-tier suppliers and contractors. The reviews may be conducted by the organization or by an independent third party. The reviews consider documented processes, documented controls, all-source intelligence, and publicly available information related to the supplier or contractor. Organizations can use open-source information to monitor for indications of stolen information, poor development and quality control practices, information spillage, or counterfeits. In some cases, it may be appropriate to share review results with other organizations in accordance with any applicable inter-organizational agreements or contracts.	SR-3, SR-5
SR-6 (1)	2	Supply Chain Risk Management Supplier Reviews Penetration Testing and Analysis	Employ [Selection (one or more): organizational analysis; independent third-party analysis; organizational penetration testing; independent third-party penetration testing of the following supply chain elements, processes, and actors associated with the system, system component, or system service: [Assignment: organization-defined supply chain elements, processes, and actors].	Penetration testing and analysis addresses the analysis or testing of the supply chain. Relationships between entitles and procedures within the supply chain, including development and deliven, are considered. Supply chain elements include arganizations, entities, or tools use for the development, acquisition, deliver, maintenance and disposal of systems, system components, or system services. Supply chain processes include personnel and physical security programs, hardware, software, and firmware development processes; configuration management tools, techniques, and measures to maintain provenance; shipping and handling procedures, and programs, processes, or procedures associated with the production and distribution of supply chain elements. Supply chain actors are individuals with specific roles and responsibilities in the supply chain. The evidence generated and collected during analyses and testing of supply chain elements, processes, and actors is documented and used to inform organizational risk management activities and decisions.	CA-S
SR-7	1	Supply Chain Risk Management Supply Chain Operations Security	Employ the following Operations Security (OPSEC) controls to protect supply chain-related information for the system, system component, or system service: [Assignment: organization-defined Operations Security (OPSEC) controls].	Supply chain OPSEC expands the scope of OPSEC to include suppliers and potential suppliers. OPSEC is a process that includes identifying critical information; analyzing friendly actions related to operations and other activities to identify those actions that can be observed by potential adversaries, determining indicators that potential adversaries might obtain that could be interpreted or pieced together to derive information in sufficient time to cause harm to organizations; implementing safeguards or countermeasures to eliminate or reduce exploitable vulnerabilities and thus risk to an acceptable level; and finally, considering how aggregated information may expose users or specific uses of the supply chain. Supply chain information includes user identities; uses for systems, system components, and system services; supplier identities; user for systems, system component configurations; supplier processes; design specifications; and testing and evaluation results. Supply chain OPSEC may require organizations to withhold mission or business information from suppliers and may include the use of intermediaries to hide the end use, or users of systems, system components, or system services.	SC-38
SR-8	1	Supply Chain Risk Management Notification Agreements	Establish agreements and procedures with entities involved in the supply chain for the system, system component, or system service for the [Selection (one or more): notification of supply chain compromises; results of assessments or audits; [Assignment: organization-defined information]].	The establishment of agreements and procedures facilitates communications among supply chain entities. Early notification of compromises and potential compromises in the supply chain that can potentially adversely affect or have adversely affected or grainational systems or system components, is essential for organizations to effectively respond to suit nicidents. The results of assessments or audits may include open-source information that contributed to a decision or result and could be used to help the supply chain entity resolve a concern or improve its processes.	IR-4, IR-6, IR-8
